THE STATE OF NEW HAMPSHIRE

MERRIMACK, SS. SUPERIOR COURT
217-2020-CV-00573

STATE OF NEW HAMPSHIRE,

Plaintiff,

vs.

MONSANTO CO.,
SOLUTIA, INC., and
PHARMACIA LLC,

Defendants.

COMPLAINT[1]

Plaintiff, the State of New Hampshire (the "State"), files this Complaint against defendants Monsanto Company, Solutia, Inc., and Pharmacia LLC (collectively, "Defendants"). Under principles of successor liability and/or by agreement, all three Defendants have succeeded to the liabilities of an earlier Monsanto entity that made and sold polychlorinated biphenyls ("PCBs")—a toxic chemical that has contaminated the State's surface water, sediment, fish, wildlife, marine resources, and other natural resources and public property. The three Defendants and this predecessor are referred to herein as "Monsanto." The State brings this action as trustee, steward and/or owner of these damaged resources, and in its *parens patriae* capacity. The State alleges as follows:

I. INTRODUCTION

1. PCBs have contaminated New Hampshire for decades and the State is now aware that the scope and persistence of PCB contamination are much greater than previously understood by the public, the State, and municipal governments. Recently discovered information about the

[1] Jury trial requested.

extent of Monsanto's proprietary knowledge and its dissemination of misinformation have also documented Monsanto's extraordinary role in causing this widespread contamination.

2. PCBs are toxic synthetic organic chemical compounds that were manufactured, marketed, sold, and distributed by Monsanto in the United States from approximately 1929 to 1977. During that period, Monsanto was responsible for the manufacture of 99% or more of all PCBs used or sold within the United States. There are no known natural sources of PCBs in the environment.

3. Because of PCBs' proven toxicity and persistence in the environment, production and most uses of PCBs were prohibited in the United States in 1979, when the U.S. Environmental Protection Agency ("EPA") promulgated final regulations banning PCBs under the Toxic Substances Control Act ("TSCA"), enacted by the U.S. Congress in 1976.

4. At the time it manufactured, marketed, distributed, and sold commercial PCB formulations—often under the trade name "Aroclor"—Monsanto knew or should have known that PCBs were highly toxic, harmful to human and animal health, and environmentally harmful. Internally, the company acknowledged as early as 1937 that PCBs produce systemic toxic effects upon prolonged exposure. In the 1950s, Monsanto's Medical Office specifically advised workers not to eat lunch in the PCB department. In 1955, Monsanto's medical director openly declared that "[w]e know Aroclors are toxic."

5. Despite its early knowledge of the dangers associated with PCBs, Monsanto embarked on a decades-long campaign of misinformation and deception to prolong the manufacture, sale, and use of its commercial PCB mixtures, under trade names including Aroclor as well as Pydraul, Turbinol, and others, in New Hampshire and elsewhere.

6. Monsanto vigorously denied in public statements that PCBs are harmful to human and environmental health, despite accumulating a wealth of knowledge contradicting such statements.

7. Monsanto knew or should have known, particularly based on its knowledge of the environmental risks associated with related chlorinated hydrocarbons like DDT (which Monsanto also manufactured) that its PCB formulations would inevitably volatilize and leach, leak, and escape their intended applications, contaminating runoff during naturally occurring storm and rain events—and thereby enter waterbodies, sediment, soils, and plants, as well as fish and other wildlife throughout New Hampshire. PCBs used in construction materials and equipment in public buildings also have caused the State to incur remediation costs and will continue to do so. Monsanto was substantially certain that this contamination of buildings and natural resources would occur as a result of the ordinary uses of its PCB products.

8. Monsanto also knew or should have known that PCBs persist in the natural environment rather than break down over time. The environmental persistence of PCBs and their resistance to breaking down are highly correlated with their chlorine content: the higher the chlorine content in a given PCB formulation, the more persistent it is. Monsanto sold many high-chlorination PCB formulations for uncontrolled uses.

9. Monsanto also knew or should have known that PCBs bio-accumulate and bio-magnify in animal tissue, including in fish tissue and human tissue. As a result, PCB concentrations in animals higher in the food chain (including humans) are higher than those in animals lower in the food chain. And, as time passes, PCB contamination poses an increasingly hazardous threat to the health of New Hampshire residents.

10. Nonetheless, Monsanto sold its PCB products for a variety of uses, including household uses. PCBs were sold for use in paints, caulks, inks, dyes, lubricants, sealants, plasticizers, coolants, hydraulic fluids, fireproofing, and industrial electrical equipment such as capacitors and transformers, among other applications. Monsanto also manufactured and sold various products incorporating their PCB formulations.

11. Monsanto's internal documents show that the company deliberately decided to keep selling PCB mixtures despite the mass contamination they inevitably caused. For example, in 1969, Monsanto admitted internally that there was "little probability that any action that can be taken will prevent the growing incrimination of specific polychlorinated biphenyls … as nearly global environmental contaminants leading to contamination of human food (particularly fish), the killing of some marine species (shrimp), and the possible extinction of several species of fish eating birds." Monsanto acknowledged that there was "no practical course of action" to prevent this mass contamination, but still insisted on taking steps "to prolong the manufacture, sale and use of these particular Aroclors as well as to protect the continued use of other members of the Aroclor series." Another internal Monsanto document was more succinct about the reasons why: "there is too much customer/market need and selfishly too much Monsanto profit to go out."

12. Monsanto's PCBs now widely contaminate New Hampshire's natural resources. Addressing this contamination has cost (and will continue to cost) the State many millions of dollars.

13. PCBs impair at least 63,000 acres of surface water, located in the Atlantic Ocean, estuaries, rivers, lakes, and ponds (including Squam Lake and Little Squam Lake) and at least 2.3 linear miles of the Souhegan River. In many of these areas, the State has been forced to issue stringent advisories against regular consumption of certain fish and/or shellfish. In some waters,

these advisories totally prohibit consumption of any fish. In addition to this impairment, PCBs have also contaminated loon eggs in more than 20 lakes in New Hampshire, including at Squam Lake, where PCBs have contributed to a significant reduction in the loon population. These lakes comprise tens of thousands of additional acres of surface water impacted by PCB contamination.

14. The State has incurred and will continue to incur costs responding to PCB contamination attributable to Monsanto. By way of example only, the State has incurred and continues to incur costs to monitor and enforce compliance with PCB limits and conditions contained in permits issued under the Clean Water Act and RSA 485-A:13. These limits and conditions are included in discharge permits as a means of ensuring the State's water quality standards for PCBs are met and maintained. The State has likewise incurred and continues to incur costs in assessing and developing plans to reduce the occurrence of PCBs in its natural resources, such as through source control and pollutant mass interception measures, stormwater management initiatives, permitting programs, municipal oversight programs, and other regulatory programs designed to control or reduce PCB loading.

15. The State's residents and natural resources, including its water bodies and water systems, have been and continue to be damaged by PCBs manufactured, marketed, distributed, and introduced into commerce by Monsanto. The State has borne and will continue to bear the natural resources damages from this PCB contamination in the form of a degraded and polluted natural environment. The State, moreover, will be forced to incur costs to combat this contamination—costs which rightfully should be borne by Monsanto.

II. JURISDICTION AND VENUE

16. This Court has jurisdiction over this matter pursuant to RSA 491:7.

17. Venue is proper in this Court because the State is considered to be a resident of Merrimack County.

III. PARTIES

A. THE STATE.

18. Plaintiff the State of New Hampshire is represented by and through the Attorney General of the State of New Hampshire with principal offices at 33 Capitol Street, Concord, New Hampshire.

19. The State is trustee and steward of the surface waters located within or flowing through the boundaries of the State and of fish, wildlife and marine resources within the State.

20. The State owns certain lands in fee within the State, and holds in trust both the waters and the land beneath Great Ponds (ponds greater than 10 acres) and tidal waters. The State holds public lands, waters and other natural resources in trust for the benefit of its citizens, and holds easement interests in other lands to protect the conservation and natural resource values of the lands.

21. The contamination of surface water, sediment, fish, wildlife, marine resources, and other natural resources with PCBs has damaged the value and use (including, but not limited to, beneficial and existence uses) of these resources.

22. In addition, the State has a sovereign or a quasi-sovereign interest in the quality of State property, surface water, sediment, fish, wildlife, marine resources, and other natural resources in the State.

23. The contamination of State property, surface water, sediment, fish, wildlife, marine resources, and other natural resources with PCBs has injured many thousands of New Hampshire residents throughout the State.

24. As *parens patriae*, the State has an interest in ensuring that surface water, sediment, fish, wildlife, marine resources, and other natural resources and public property can be safely used

and enjoyed by its residents and that the health and well-being of its residents is not harmed by such use.

B. THE DEFENDANTS.

25. Defendant Monsanto Company ("New Monsanto") is a Delaware corporation with its principal place of business in St. Louis, Missouri. Following a merger transaction that closed in 2018, New Monsanto is a wholly-owned subsidiary of Bayer AG.

26. Defendant Solutia, Inc. ("Solutia") is a Delaware corporation with its principal place of business in St. Louis, Missouri. Solutia is a wholly-owned subsidiary of Eastman Chemical Company.

27. Defendant Pharmacia LLC ("Pharmacia" or "Pharmacia LLC"), formerly known as Pharmacia Corporation, is the successor to the original Monsanto Company ("Old Monsanto"). Pharmacia LLC is a Delaware company with its principal place of business in Peapack, New Jersey. Pharmacia is a wholly-owned subsidiary of Pfizer, Inc.

28. Old Monsanto operated an agricultural products business, a pharmaceutical and nutrition business, and a chemical products business. Old Monsanto began manufacturing PCBs in 1935 after acquiring Swann Chemical Company, which manufactured PCBs from 1929 to 1935. Old Monsanto continued to manufacture commercial PCBs until the late 1970s.

29. Through a series of transactions beginning in approximately 1997, Old Monsanto's businesses were spun off to form three separate corporations.

30. The corporation now known as Monsanto Company (and referred to herein as "New Monsanto") operates Old Monsanto's agricultural products business.

31. Old Monsanto's chemical products business is now operated by Solutia.

32. Old Monsanto's pharmaceuticals business is now operated by Pharmacia.

33. Solutia was organized by Old Monsanto to own and operate its chemical manufacturing business. Solutia assumed the operations, assets, and liabilities of Old Monsanto's chemical business.

34. Although Solutia assumed and agreed to indemnify Pharmacia for certain liabilities related to the chemicals business, Defendants have also entered into agreements to share or apportion liabilities, and/or to indemnify one or more entities, for claims arising from Old Monsanto's chemical business, including the manufacture and sale of PCBs.

35. In 2003, Solutia filed a voluntary petition for reorganization under Chapter 11 of the U.S. Bankruptcy Code. Solutia's reorganization was completed in 2008. In connection with Solutia's Plan of Reorganization, Solutia, Pharmacia, and New Monsanto entered into several agreements under which New Monsanto continues to manage and assume financial responsibility for certain tort litigation and environmental remediation related to the chemicals business.

36. Eastman Chemical Co. reported in its 2019 Form 10-K that it "has been named as a defendant in several [legacy tort] proceedings, and has submitted the matters to Monsanto, which was acquired by Bayer AG in June 2018, as Legacy Tort Claims [as defined in a settlement agreement with Monsanto arising out of Solutia, Inc.'s bankruptcy proceedings]. To the extent these matters are not within the meaning of Legacy Tort Claims, Solutia could potentially be liable thereunder. In connection with the completion of its acquisition of Solutia, Eastman guaranteed the obligations of Solutia and Eastman was added as an indemnified party under the Monsanto Settlement Agreement."

37. In its Form 10-K for the period ending August 31, 2017, filed with the U.S. Securities and Exchange Commission (the last such filing before Bayer AG acquired New Monsanto), New Monsanto represented: "[New] Monsanto is involved in environmental

remediation and legal proceedings to which Monsanto is a party in its own name and proceedings to which its former parent, Pharmacia LLC or its former subsidiary, Solutia, Inc. is a party but that Monsanto manages and for which Monsanto is responsible pursuant to certain indemnification agreements. In addition, Monsanto has liabilities established for various product claims. With respect to certain of these proceedings, Monsanto has established a reserve for the estimated liabilities." The filing specifies that the company held $277 million in that reserve as of August 31, 2017.

IV. FACTUAL ALLEGATIONS

A. PCBs HARM HUMANS AND THE ENVIRONMENT.

1. Physical and chemical properties of PCBs.

38. PCBs are a class of synthetic organic chemical compounds in which a minimum of two and a maximum of ten chlorine atoms are attached to the biphenyl molecule.

39. There are no known natural sources of PCBs in the environment.

40. PCBs are either oily liquids or solids, and are colorless to light yellow. They have no known smell or taste.

41. There are 209 distinct PCB compounds (known as congeners) with from 1 to 10 chlorine atoms on a biphenyl molecule. The number and placement of the chlorine atoms on the biphenyl molecule determine how the congener is named and dictate its environmental fate and toxicity. PCBs generally occur as mixtures of congeners.

42. Monsanto manufactured PCB mixtures primarily under the "Aroclor" trade name.

43. Aroclors are differentiated principally by the composition of chlorine by weight, so, for example, "Aroclor 1254" means the mixture contains approximately 54% chlorine by weight.

44. Generally, the higher the chlorine content of a PCB mixture, the higher its persistence and toxicity.

45. PCBs do not burn easily, are hydrophobic (i.e., they do not dissolve in water but rather cluster together), and bio-accumulate and bio-magnify in living tissue.

46. PCBs entered the air, water, and soil during their ordinary and prescribed uses. Indeed, PCBs have gradually escaped and dispersed from their common applications, *e.g.* in road paint or caulking, into the natural environment due to the chemical compounds' inherent tendency to volatilize, that is to emit PCB vapors, particularly when exposed to heat (such as when road paint or building materials are exposed to the sun over time).

47. As vapors, PCBs travel through the air, eventually settling in nearby soil, sediment, or waterbodies.

48. PCBs also entered the environment from spills or leaks in the ordinary course of business such as through transport of the chemicals, and from leaks or fires in transformers, capacitors, or other products containing PCBs, and from the burning of wastes in some municipal or industrial incinerators.

49. In addition, Monsanto prescribed that PCBs and PCB-contaminated wastes should be disposed of in the ordinary course in landfills, from where they easily escaped, leached, and leaked into the surrounding environment.

50. Once in the environment, PCBs do not break down readily and may remain for decades absent remediation.

51. In water, PCBs may be transported by currents, attach to bottom sediment or particles in the water, and evaporate into air. Sediments contaminated with PCBs also release PCBs into surrounding water.

52. As a gas, PCBs can accumulate in the leaves and above-ground parts of plants and food crops.

53. In water, PCBs are taken up into the bodies of small organisms and fish. They are also taken up by other animals that eat these aquatic animals as food, and eventually by humans.

54. PCBs especially accumulate in fish and marine animals, reaching levels that may be many thousands of times higher than in water because PCBs are soluble in lipids, including body fat, and bio-accumulate and bio-magnify over time in living tissue. Thus, PCB levels are highest in animals higher up the food chain.

55. PCBs are inert in that they resist both acids and alkalis, and have thermal stability.

2. Health and ecological effects of exposure to PCBs.

56. Humans are exposed to PCBs primarily from eating contaminated food, breathing contaminated air, or drinking or swimming in contaminated water.

57. The major dietary sources of PCBs are fish (especially sportfish caught in contaminated waterbodies), meat, and dairy products. PCBs also collect in milk fat and can enter the bodies of infants through breast-feeding.

58. Fetuses in the womb are also exposed to PCBs through their mothers. Studies show that babies born to mothers exposed to high concentrations of PCBs in the workplace or from eating PCB-contaminated fish suffer from lower birth weight than other babies. Babies born to women exposed to PCBs before and during pregnancy showed abnormal responses to infant behavioral tests, including motor skills, and experienced short-term memory deficiencies.

59. Many studies have examined how PCBs affect human health.

60. Human health effects associated with PCB exposure include without limitation liver, thyroid, dermal, and ocular changes, immunological alterations, neuro-developmental and neurobehavioral changes, reduced birth weight, reproductive toxicity, and cancer.

61. Liver changes associated with PCB exposure include liver enlargement, microsomal enzyme induction (altered metabolism), increased levels of enzymes indicative of hepatocellular damage and serum and tissue biochemical changes indicative of liver dysfunction, and histopathological changes concerning fat deposition, as well as fibrosis and necrosis.

62. Thyroid changes associated with PCB exposure include goiter and increased thyroid gland volume, histological changes in the thyroid gland indicative of stimulation of the gland and disruption of the processing of follicular colloid needed for normal production and secretion of thyroid hormone, depressed thyroid hormone levels, and modified (increased or decreased) activity in producing and transferring enzymes necessary for thyroid hormone production.

63. Due to the importance of the thyroid to brain development, PCBs' effects on the thyroid produce neurodevelopmental effects.

64. Dermal changes associated with PCB exposure include skin irritation, chloracne (a dermatological condition starting with formation of keratin plugs and inflammatory folliculitis), and nail and skin pigmentation changes.

65. Ocular changes associated with PCB exposure include hypersecretion of Meibomian glands, abnormal pigmentation of the conjunctiva, and swollen eyelids.

66. Immunological alterations associated with PCB exposure include decreased antibody levels, changes in T-cell subsets, and increased susceptibility to respiratory tract infections, infectious illnesses, and middle ear infections.

67. Neurological changes associated with PCB exposure include abnormal reflexes and deficits in memory, learning, impulse control, and IQ. Such changes impact infants and children more severely than adults.

68. Reproductive changes associated with PCB exposure include menstrual disturbances in women and effects on sperm morphology and production in men, all of which can result in difficulty conceiving.

69. PCBs are associated with a number of cancers, including cancer of the liver, biliary tract, intestines, and skin (melanoma).

70. Studies of workers routinely exposed to PCBs show that PCB exposure is associated with irritation of the nose and lungs, gastrointestinal discomfort, changes in the blood and liver, and depression and fatigue, as well as cancer of the liver and biliary tract.

71. In 1996, EPA assessed PCB carcinogenicity based on data related to Aroclors 1016, 1242, 1254, and 1260. EPA's cancer assessment was peer-reviewed by 15 experts on PCBs, including scientists from government, academia, and industry. All experts agreed that PCBs are probable human carcinogens.

72. The U.S. Department of Health and Human Services' National Toxicology Program considers PCBs to be "reasonably anticipated" carcinogens.

73. The International Agency for Research on Cancer, an intergovernmental agency forming part of the World Health Organization of the United Nations, concluded in March 2013, based on the assessments of 26 experts from 12 countries, that PCBs are known human carcinogens.

74. In its formal 2016 report, the IARC stated unequivocally, "There is sufficient evidence in humans for the carcinogenicity of [PCBs]. PCBs cause malignant melanoma. Positive associations have been observed for non-Hodgkin lymphoma and cancer of the breast. … PCBs are carcinogenic to humans . . . ."

75. In addition to being highly toxic to humans, Monsanto's commercial PCB mixtures are highly toxic to fish and wildlife.

76. Toxicity studies have demonstrated that commercial PCB mixtures induce hepatotoxicity, immunotoxicity, neurotoxicity, and reproductive toxicity in birds and mammals.

77. Studies of bird populations have drawn strong correlations between elevated PCB concentrations in blood and declining bird populations, as well as increased frequency of developmental abnormalities and deformities.

78. PCBs have also been shown to cause eggshell thinning in many bird species, including loons, resulting in reproductive failure and generally decreased reproductive capacity.

79. Mammalian studies have shown that PCB exposure adversely affects patterns of survival, reproduction, growth, metabolism, and accumulation.

80. Studies on bats, dogs, cats, foxes, minks, otters, bears, rats, monkeys, and other mammals, including marine mammals, have generated strong associations between exposure to commercial PCB mixtures and a host of health effects, including hepatomegaly (enlarged liver), necrosis, atrophy of lymphoid tissues, suppression of antibody responses, impaired behavior and development, catecholamine alterations (neurotransmitter interference), increased abortion, low birth weight, embryolethality, teratogenicity (embryotic malformation), gastrointestinal ulceration, bronchitis, chloracne, edema, hyperplasia (cell proliferation), mutagenicity and preneoplastic changes (tumor development).

81. Aquatic organisms are also sensitive to PCB contamination and suffer adverse effects in proportion to PCB exposure.

82. For instance, studies of reproductive effects on salmon, bass, zebrafish, and other fish species have demonstrated decreased reproductive success in populations with high PCB exposure, and PCB concentrations are directly correlated to hatching success rates.

83. PCBs also impact the reproduction of reptiles such as snapping turtles. Studies have found strong associations between low snapping turtle egg hatch rates and increased frequency of deformed hatchlings on one hand and elevated PCB concentrations in such eggs on the other.

3. The ordinary and intended use of Monsanto's PCB mixtures has resulted in widespread PCB contamination.

84. The ordinary and intended application of Monsanto's commercial and household PCB products (in, for instance, paints, caulks, lubricants, hydraulic and heat-transfer fluids, transistor and capacitor fluids, and so on) has contaminated State property, surface water, sediment, fish, wildlife, marine resources, and other natural resources, due principally to the chemical compound's well-known tendency to volatilize or redistribute itself across different environmental media.

85. PCBs continue to move from one environmental medium to another—soil to water, water to air, air to water, sediment to water—so the majority of PCBs in the air, for example, results from volatilization of PCBs from soil and water.

86. PCBs may be released to the atmosphere from landfills and hazardous waste sites, incineration of PCB wastes, or leakage and runoff from older electrical equipment in use.

87. PCBs may also be released to water from spillage of PCB-containing hydraulic fluids, historic disposal with insufficient safeguards, combined sewer overflows or storm water runoff, from organic petroleum products used as dust suppressants (e.g., on dirt roads), and from runoff and leachate from PCB-contaminated sewage sludge applied to farmland.

88. PCBs may further be released to soil from leaks and spills, releases from contaminated soils in landfills and hazardous waste sites, deposition of vehicular emissions near roadway soil, and land application of sewage sludge containing PCBs.

89. Due to their uncontrollable environmental circulation, Monsanto internally acknowledged that PCBs would inevitably contaminate the environment—even as they continued to increase their production of PCBs and to conceal or deny any association of adverse human health and ecological effects with PCBs.

B. MONSANTO KNEW PCBS WERE DANGEROUS CONTAMINANTS AT THE TIME OF MANUFACTURE, MARKETING, SALE, AND DISTRIBUTION.

90. Old Monsanto developed an early, sophisticated understanding of the dangers associated with PCB compounds.

91. In 1936, many workers at a New York facility using PCBs operated by Halowax Corporation were afflicted with severe chloracne. Three workers died and autopsies revealed severe liver damage in two of them.

92. Halowax Corporation asked Harvard University researcher Cecil K. Drinker to investigate the issue, and Dr. Drinker's analysis was presented at a 1937 meeting attended by high-level personnel employed by Old Monsanto.

93. Dr. Drinker's investigation revealed that rats exposed to PCBs suffered severe liver damage. Dr. Drinker's results were published in a September 1937 issue of the *Journal of Industrial Hygiene and Toxicology*.

94. That same year, Old Monsanto admitted in an internal report that PCBs produce "systemic toxic effects" as a result of prolonged exposure to PCB vapors or oral ingestion, and that bodily contact with PCBs produces "an acne-form skin eruption."[2]

[2] *See* Exhibit 1 (MONS 061332).

95. Old Monsanto subsequently retained Dr. Drinker to conduct further animal studies. In September 1938, Dr. Drinker confirmed liver damage in rats exposed to various formulations of PCB compounds.[3]

96. Other studies also explored and confirmed the toxicity of chlorinated hydrocarbons like PCBs. A 1939 study published in the *Journal of Industrial Hygiene and Toxicology*, for example, referred to the worker fatalities investigated by Drinker and went on to conclude that pregnant women and persons previously affected by liver disease are particularly susceptible to adverse effects from chlorinated hydrocarbons, such as PCBs.

97. In February 1950, Old Monsanto Medical Director Dr. R. Emmet Kelly acknowledged that when workers fell ill at an Indiana factory that used PCBs in the manufacturing process, he immediately "suspected the possibility that the Aroclor fumes may have caused liver damage."[4]

98. A 1955 report on the production of Aroclor prepared by Old Monsanto likewise acknowledged that in the "early days of development," workers at a plant in Anniston, Alabama processing PCBs had developed chloracne and liver problems.

99. In 1955, Dr. Kelly further documented the company's clear understanding: "We know Aroclors are toxic[.]"[5] Dr. Kelly also appeared to recognize the scope of Old Monsanto's potential legal liability, explaining that "our main worry is what will happen if an individual develop[s] any type of liver disease and gives a history of Aroclor exposure. I am sure the juries would not pay a great deal of attention to [maximum allowable concentration levels]."[6]

---

[3] *See* Exhibit 2 (MONS 048123) at 27-30.

[4] *See* Exhibit 3 (M11678).

[5] *See* Exhibit 4 (MONS 095196).

[6] *See* Exhibit 4 (MONS 095196).

100. Old Monsanto's Medical Department prohibited workers from eating lunch in the Aroclor department in November 1955. The Department memorandum explained that "Aroclor vapors and other process vapors could contaminate the lunches unless they were properly protected" and that "[w]hen working with this material, the chance of contaminating hands and subsequently contaminating the food is a definite possibility."[7]

101. In January 1957, Dr. Kelly reported that the U.S. Navy had refused to use Old Monsanto's PCB products in submarines: "No matter how we discussed the situation, it was impossible to change their thinking that Pydraul 150 [a PCB product marketed by Old Monsanto] is just too toxic for use in a submarine."[8]

102. Notably, at the same time it was manufacturing PCBs, Old Monsanto also manufactured—and researched the toxicological profile and environmental effect of—DDT, another now-infamous chlorinated hydrocarbon similar to PCBs.

103. By the late 1940s, Old Monsanto had already researched and compiled an extensive toxicological profile of DDT showing that it is extremely toxic to human and environmental health. Indeed, by then, scientific researchers had established that DDT and other chlorinated hydrocarbons are absorbed and stored in fatty tissue of living organisms exposed to them and pass these contaminants on to their offspring.

104. For instance, the *American Journal of Public Health* published a 1950 report warning that "chlorinated hydrocarbons, such as DDT and chlordane, are soluble in fats and are stored in the fatty tissues of the body. These compounds possess a high order of toxicity, and their

[7] *See* Exhibit 5 (Unlabeled memo from Jack T. Garrett to H.B. Patrick, Nov. 14, 1955).

[8] *See* Exhibit 6 (MONS 095640).

uncontrolled or unwise use is not desirable." As Old Monsanto knew, was substantially certain of, or should have known, the same was and is true of its PCB compounds.

105. Extensive scientific research establishing the toxicity and bio-accumulative and bio-persistent nature of DDT and other chlorinated hydrocarbons was published from the 1940s to the 1960s. Old Monsanto produced DDT and was acutely aware of this research. Old Monsanto was also acutely aware of the similarities between DDT and PCBs.

106. In 1966, the *New Scientist* published a short article ("Report of a New Chemical Hazard"), summarizing recent research by Søren Jensen, a Swedish chemist at Stockholm University's Institution of Analytical Chemistry, which estimated that PCBs may be spreading through environments in high volumes due to their use by manufacturing interests.

107. Søren Jensen had accidentally found enormous quantities of PCB compounds in wildlife while analyzing DDT accumulations. Dr. Jensen presented his findings to the scientific community in 1966. According to these findings, PCBs "appear[] to be the most injurious chlorinated compounds of all tested." Dr. Jensen reported that the "main characteristic[s]" of PCBs include their "very high stability," lack of "metaboliz[ation] in living organism[s]," and their non-flammability.

108. Old Monsanto's Medical Director, Dr. Kelly, was aware of Dr. Jensen's findings at the time.

109. In December of 1968, *Nature* published an article by Dr. Richard Risebrough of the University of California entitled, "Polychlorinated Biphenyls in the Global Ecosystem." The article assesses PCB presence in marine wildlife and reports high concentrations of PCBs detected in peregrine falcons and 34 other bird species, drawing an immediate connection between PCBs and the catastrophic decline of peregrine falcon populations in the United States.

110. Old Monsanto personnel took note of Dr. Risebrough's article, recognizing the public-relations disaster it portended. W.R. Richard, manager of Old Monsanto's Research and Development of Organics Division, wrote in early 1969 that the article shows not only that PCBs are "toxic substance[s]" but also because they are easily and broadly distributed in air and water, they are "an uncontrollable pollutant … causing [the] extinction of [the] peregrine falcon … [and] endangering man himself."[9]

111. Also in 1969, Dr. Jensen published the formal results of his years-long research into PCBs in the environment. Dr. Jensen's research demonstrated very high PCB concentrations in Baltic Sea fauna such as white-tailed sea eagles. As a recent commentator observed, summarizing the implications of Dr. Jensen's results, "PCBs had entered the environment in large quantities for more than 37 years and were bio-accumulating along the food chain."

112. In September 1969, W.R. Richard wrote a memorandum titled, "Defense of Aroclor." Richard's memo notes that critics of PCBs have raised a multitude of different issues with the compounds, so "[w]e can't defend vs. everything. Some animals or fish or insects will be harmed. Aroclor degradation rate will be slow. Tough to defend against. Higher chlorination compounds will be worse [than] lower chlorine compounds.[10] Therefore, we will have to restrict uses and clean-up as much as we can, starting immediately." In the same document, Richard admitted that PCBs will leak from virtually all applications, including such "closed" applications as air compressor, heat transfer, and capacitor fluids.[11]

[9] *See* Exhibit 7 (MONS 096509).

[10] *See* Exhibit 8 (DSW 014256).

[11] *See* Exhibit 8 (DSW 014256) at -57-59.

113. That same month, Old Monsanto formed what it dubbed the "Aroclor Ad Hoc Committee" to strategize about defending its PCB business against growing public outcry and growing evidence of PCBs' toxicity and environmental harms.

114. The minutes of the Committee's first meeting observed that PCBs had been found in fish, oysters, shrimp, and birds, along the coasts of industrialized areas including Great Britain, Sweden, the Rhine River, Lake Michigan, Pensacola Bay, and in wildlife throughout the Western hemisphere.[12]

115. The Committee acknowledged that normal and intended uses of PCB-containing products were the cause of the contamination: "In one application alone (highway paints), one million lbs/year are used. Through abrasion and leaching we can assume that nearly all of this Aroclor winds up in the environment."[13]

116. The Committee worked to formulate a response to growing concerns over PCBs, including those reflected by the U.S. Department of the Interior's Fish and Wildlife Service (which found PCBs in dead eagles and marine birds), the Bureau of Commercial Fisheries (which found PCBs in the river below Monsanto's Pensacola plant), and the U.S. Food and Drug Administration (which found PCBs in milk supplies).

117. The Committee's constitutive agenda was to: "1. Protect continued sales and profits of Aroclors; 2. Permit continued development of new uses and sales; and 3. Protect the image of the Organic Division and the Corporation as members of the business community recognizing their responsibilities to prevent and/or control contamination of the global ecosystem."[14]

[12] *See* Exhibit 9 (MONS 030483).

[13] *See* Exhibit 9 (MONS 030483) at -85.

[14] *See* Exhibit 10 (DSW 014612) at -14.

118. As the minutes reflect, "there is little probability that any action that can be taken will prevent the growing incrimination of specific polychlorinated biphenyls … as nearly global environmental contaminants leading to contamination of human food (particularly fish), the killing of some marine species (shrimp), and the possible extinction of several species of fish eating birds." However, while "there is no practical course of action that can so effectively police the uses of these products as to prevent environmental contamination … [t]here are … a number of actions which must be undertaken to prolong the manufacture, sale and use of these particular Aroclors as well as to protect the continued use of other members of the Aroclor series."[15]

119. In keeping with the corporate strategy reflected in the Aroclor Ad Hoc Committee meeting minutes and elsewhere, Old Monsanto not only continued producing Aroclors through 1969, but increased production that year and in 1970, which were the highest volume production years in the history of PCBs.

120. Old Monsanto likewise vigorously protected its Aroclor brand from regulatory intrusion. Old Monsanto falsely told regulators that it "d[id] not believe the polychlorinated biphenyls to be seriously toxic," that Old Monsanto could not "conceive of how the PCBs can become wide spread in the environment,"[16] and that, in light of PCBs' chemical inertness, Old Monsanto "would anticipate no problems associated with the environment from refuse dumps."[17]

121. Elmer Wheeler, in Old Monsanto's Medical Department, circulated laboratory reports discussing results of animal studies in January 1970, in which Dr. Wheeler noted that

[15] *See* Exhibit 10 (DSW 014612) at -15.

[16] *See* Exhibit 11 (NCR-FOX-0575899) at -900-01.

[17] *See* Exhibit 12 (NEV 031051) at -52.

"PCBs are about the same as DDT in mammals."[18] At this time, Old Monsanto had known for decades that DDT was highly toxic and environmentally unsafe.

122. At the same time that it was internally acknowledging that PCBs are "about the same" as DDT, in January 1970, the journal *Environment* published a note authored by Old Monsanto: "Monsanto Statement on PCB." The company note acknowledged that recent studies, including Dr. Jensen's studies, indicated PCBs' widespread presence in the natural environment, and expressed the company's "concern[] over the situation."

123. However, the note defended PCBs by deploying a variety of false statements that Old Monsanto used on multiple occasions in the late 1960s and early 1970s to minimize the negative impacts of PCBs.

124. In particular, Old Monsanto claimed that:

(a) PCBs cannot escape so-called "closed applications" where PCBs are "completely sealed in metal containers";

(b) PCBs cannot escape applications such as adhesives, elastomers, and surface coatings;

(c) PCBs are not "to our knowledge" used in "household products"; and

(d) it is simply "not true" that PCBs are "highly toxic."

125. Old Monsanto knew that all of the statements in the foregoing paragraph were untrue and would tend to mislead regulators and the public when they published them.

126. Similarly, Old Monsanto falsely asserted in the note that research it conducted into PCB toxicity in fish and mammals and PCB presence in waters and soils provided "[v]ery early results . . . that PCBs are not highly toxic."

[18] *See* Exhibit 13 (MONS 098480).

127. Contrary to their published claims, Old Monsanto knew PCBs would leach, leak, off-gas, and escape their ordinary and intended applications, including closed applications, and cause significant injury to natural resources and human life.

128. Old Monsanto also knew that the PCBs they produced were used in "household products" and that Old Monsanto aggressively promoted the use of PCBs in "household products." For example, in a 1960 brochure, Old Monsanto promoted the use of Aroclors in a wide variety of household and personal products including home appliances, food cookers, potato chip fryers, thermostats, automotive transmission oil, insecticides, waxes used in dental casting, jewelry, lubricants, adhesives, moisture-proof coatings, printing inks, papers, sealants and caulking compounds, tack coatings, asphalt, paints, varnishes, lacquers, masonry coatings for swimming pools, stucco homes, and protective or decorative coatings for a number of other finishes.[19]

129. A 1961 brochure published by Old Monsanto explained that Aroclors are used in "lacquers for women's shoes," as a "wax for the flame proofing of Christmas trees," as "floor wax," as an adhesive for bookbinding, leather, and shoes, and as invisible marking ink used to make chenille rugs and spreads.[20]

130. Monsanto also knew that PCBs were used in products certain to directly result in contamination of the environment, such as highway paints and other exterior applications.

131. Old Monsanto knew their PCB compounds were highly toxic as early as 1937. Old Monsanto also knew well before 1970 that a number of studies, both internal and external, had demonstrated human and animal toxicity and prevalent contamination of waters and soils.

[19] *See* Exhibit 14 (LEXOLDMON004615).

[20] *See* Exhibit 15 (0627503).

132. In February 1970, Old Monsanto's high-level personnel circulated a talking-points memorandum to be used in engaging with customers raising concerns over PCB toxicity. Although Old Monsanto had reformulated certain high-chlorine congeners (Aroclor 1254 and 1260) to lower the chlorine content, it instructed employees to resist product returns of the more toxic congener formulations, explaining that Old Monsanto "can't afford to lose one dollar of business."[21]

133. The same February 1970 memo instructed employees to advise customers to use up their existing Aroclor 1254 and 1260 stock before topping up with new fluids: "We don't want to take fluid back."[22]

C. MONSANTO FAILED TO WARN AND ACTIVELY DECEIVED REGULATORS AND THE PUBLIC CONCERNING THE HAZARDS OF PCBS.

134. Monsanto knew that PCBs are toxic to human and environmental health, and that their commercial PCB products would leach, leak, off-gas, and escape their ordinary and intended applications and from disposal sites—regardless of the nature of the application—to contaminate waters, soils, and air. Yet Monsanto issued no public warning or instruction about PCBs or the health and environmental safety hazards they present. Instead, Monsanto expressly denied the harmfulness and environmental toxicity of PCBs.

135. Monsanto made no public disclosure of the high risk that PCBs posed to the environment and continued to recommend disposal of PCB waste materials in local landfills.

136. Regarding its own PCB waste, Old Monsanto executive William Papageorge wrote in a letter dated March 6, 1970 that, "All waste containing PCB's [*sic*] is at present hauled to the dumps the plants have been using for other plant waste. We recognize this is not the ultimate,

[21] *See* Exhibit 16 (MONS 100123) at -24.

[22] *See* Exhibit 16 (MONS 100123).

since PCB's [*sic*] could eventually enter the environment, but we will continue this practice until better methods of disposal are available."

137. Mr. Papageorge further acknowledged in testimony provided in 1975 to the Wisconsin Department of Natural Resources that Old Monsanto generally recommended disposal of PCB-contaminated wastes in landfills.

138. As government investigations and formal inquiries into the dangers of PCBs amplified in the late 1960s and early 1970s, Old Monsanto doubled down on its campaign of misinformation and denial.

139. For example, Howard S. Bergen, from Old Monsanto's Functional Fluids division, sent a letter dated March 27, 1969, to the Regional Water Quality Control Board of the San Francisco Bay Region, in which he claimed that PCBs are associated with "no special health problems," and that due to PCBs' chemical inertness, "we would anticipate no problems associated with the environment from refuse dumps."[23] Both of those statements were false, and Monsanto knew they were false.

140. Dr. Wheeler, Assistant Director of Old Monsanto's Medical Department told a representative of the National Air Pollution Control Administration in May 1969 that Old Monsanto "cannot conceive how the PCBs can be getting into the environment in a widespread fashion." The representative promised to convey this message to Congress.

141. Old Monsanto similarly claimed ignorance of how PCBs could be entering the environment in large quantities to a number of other public entities, regulators, and authorities, including the New Jersey Department of Conservation.

[23] *See* Exhibit 12 (NEV 031051) at -52.

142. In July 1969, the company claimed that, "[b]ased on the available data, manufacturing and use experience, we do not believe PCBs to be seriously toxic," adding that, "we are unable at this time to conceive of how the PCBs can become widespread in the environment. It is certain that no applications to our knowledge have been made where the PCB's would be broadcast in the same fashion as the chlorinated hydrocarbon pesticides have been."[24] Monsanto knew or was substantially certain that those statements were false.

143. Old Monsanto's Dr. Kelly communicated with the Ohio State Board of Health in March 1970 regarding the detection of PCBs, particularly Aroclor 1254, in samples of milk from at least three herds in Ohio. The Board traced this contamination back to Aroclor-containing paint flaking off and possibly leaching from the interior walls of the silos in which the milk was stored. The Board reported to Old Monsanto that it would have to destroy about 150 tons of milk, valued at about $30 per ton. The Board also reported that there may be 50 other silos similarly contaminated in the state that were painted with the same formulation.

144. In response, Dr. Kelly communicated to other Old Monsanto officials:

> All in all, this could be quite a serious problem, having legal and publicity overtones. This brings us to a very serious point. When are we going to tell our customers not to use any Aroclor in any paint formulation that contacts food, feed, or water for animals or humans? I think it is very important that this be done.[25]

145. Old Monsanto never heeded Dr. Kelly's admonition to warn of the dangers of similar applications of Aroclors.

146. An internal memorandum prepared by Dr. Kelly dated February 10, 1967, continued to express his concern about PCB contamination: "We are very worried about what is

[24] *See* Exhibit 11 (NCR-FOX-0575899) at -900-01.

[25] *See* Exhibit 17 (Unlabeled correspondence – Kelly to Papageorge).

liable to happen in the [United States] when the various technical and lay news media pick up the subject [of PCB contamination]. This is especially critical at this time because air pollution is getting a tremendous amount of publicity in the United States."[26]

147. The same memo noted that some of Monsanto's largest PCB customers, such as NCR (National Cash Register), had been pressing Monsanto to furnish more information on PCB safety, but that Monsanto had dodged their inquiries.[27]

148. Old Monsanto's misrepresentations and omissions to public entities and others were designed to conceal the toxicity and hazardousness of its PCB formulations to humans and the natural environment in order to salvage what Monsanto repeatedly emphasized was "one of Monsanto's most profitable franchises," generating tens of millions of dollars in annual revenues.

149. An internal presentation to the Corporate Development Committee generated in or around 1969 advised against exiting the Aroclor market despite clear knowledge of its dangers because "there is too much customer/market need and selfishly too much Monsanto profit to go out."[28]

150. Another internal Monsanto memorandum remarked, "There can not [*sic*] be too much emphasis given to the threat of curtailment or outright discontinuance of the manufacture and sales of this very profitable series of compounds."[29]

151. Old Monsanto had a complete and comprehensive record of all PCB-related scientific research and general reportage during the relevant time period. An August 6, 1971 Old

[26] *See* Exhibit 18 (MONS 031358) at -58.
[27] *See* Exhibit 18 (MONS 031358) at -59.
[28] *See* Exhibit 19 (MONS 058730) at -37.
[29] *See* Exhibit 10 (DSW 014612) at -24.

Monsanto internal memorandum noted that the company "ha[s] probably the world's best reference file on the PCB situation."

152. In short, despite its extensive knowledge of the true dangers of PCBs, Old Monsanto failed to timely alert regulators and the public of the dangers of its PCBs, and did not take adequate steps to stave off the impending environmental disaster, all to shield its sales, profits, and reputation.

D. THE STATE HAS BEEN DAMAGED BY MONSANTO'S PCBS.

153. The quality of the State property, water resources, sediments, fish and aquatic life, and other natural resources directly and significantly affects the quality of life of the State's residents.

154. Between 1929 and 1977, Monsanto sold a large volume of commercial PCB mixtures and PCB-containing products to various customers, including retail and secondary manufacturers, within and near the State.

155. For example, Monsanto's sales included over 400,000 pounds of PCB mixtures (e.g., Aroclor 1232 and Aroclor 1242) shipped to New Hampshire between 1968 and 1971 for use in labels and specialty papers. PCBs used in the paper industry frequently escaped during manufacturing processes or were discharged with effluent from paper manufacturing plants. These PCBs also leached, leaked, off-gassed, and escaped from finished paper products, which were simply discarded by the end consumer. There was never any warning from Monsanto that these practices were bound to cause contamination in New Hampshire.

156. Similarly, Monsanto shipped over 80,000 pounds of PCB mixtures (e.g., Aroclor 5460) to New Hampshire between 1968 and 1972 for use in making machined parts. PCBs would escape during the manufacturing processes and from the wastes generated during manufacture, which were disposed of in landfills as Monsanto advised. There was never any warning from

Monsanto that the use and disposal of PCBs in this manner would inevitably cause these highly toxic and volatile chemicals to enter and contaminate State resources.

157. Monsanto never advised the State or the public that Monsanto's PCB mixtures are toxic to human and environmental health and that those PCBs would leach, leak, off-gas, and escape their ordinary and intended applications and from disposal sites, regardless of the nature of the application, to contaminate the State's waters, soils, and air. Monsanto issued no public warning or instruction about PCBs or the health and environmental safety hazards they present and indeed, as alleged above, denied that such hazards exist in their communications with public entities and the general public.

158. Instead, when Monsanto provided any information concerning the use and disposal of PCBs, Monsanto denied toxicity concerns and adverse human and environmental health effects, and advised that PCBs were safe for their intended uses and wastes should be deposited in landfills, despite knowing this would result in environmental contamination and human and ecological hazards.

159. Monsanto's PCB mixtures and PCB-containing products were used in countless applications within the State and leached, leaked, off-gassed, and escaped their ordinary and intended applications to contaminate surface water, sediment, fish, wildlife, marine resources, and other natural resources within New Hampshire, as well as public buildings and other property.

160. Because Monsanto's PCBs are environmentally persistent, they continue to circulate in the State's surface water, sediment, fish, wildlife, marine resources, and other natural resources to this day. They also remain in public buildings throughout New Hampshire.

161. The State has already taken steps to monitor, control, and address PCB contamination, but widespread contamination continues to cause extensive damage to the State,

posing current and future threats to human health and the well-being of the State's environment and economy.

1. Impaired water bodies in New Hampshire.

162. Like other states, New Hampshire prepares water quality monitoring and assessment reports every other year to satisfy its listing and reporting obligations under the Clean Water Act, sections 303(d) and 305(b).

163. The State's 2018 Section 303(d) Surface Water Quality List ("2018 List") identifies approximately 80.7 square miles of waters categorized as part of the Atlantic Ocean and 6.75 square miles in approximately 48 different other water bodies as impaired by PCBs. This 2018 List also states that 2.3 linear miles of the Souhegan River are impaired by PCBs.

164. The 2018 List states that portions of the following surface water bodies within New Hampshire are impaired by excessive levels of PCBs:

a) Back Creek

b) Bass Beach Brook Outfall Area

c) Berry's Brook

d) Blackwater River

e) Blind Creek Wastewater Treatment Facility

f) Blood Creek

g) Browns River (Lower)

h) Browns River (Upper)

i) Chapel Brook

j) Cocheco River

k) Country Pond

l) Fish Coop (Seabrook)

m) Hampton Falls River

n) Hampton Falls River Wastewater Treatment Facility

o) Hampton River Boat Club

p) Hampton River Marina

q) Hampton River Wastewater Treatment Facility

r) Hampton/Seabrook Harbor

s) Seabrook Harbor Beach

t) Hunts Island Creek (Lower)

u) Hunts Island Creek (Upper)

v) Lamprey River North

w) Little River

x) Lower Piscataqua River (North)

y) Lower Piscataqua River (South)

z) Lower Sagamore Creek

aa) Mill Creek

bb) North Beach Wrack Zone

cc) North Mill Pond

dd) Nudds Canal

ee) Oyster River

ff) Oyster River Mouth

gg) Parson's Creek

hh) Piscataqua River Mouth

ii) Salmon Falls River

jj) Souhegan River

kk) Souhegan River – Goldman Dam

ll) South Mill Pond

mm) Squamscott River North

nn) Squamscott River South

oo) Swains Creek

pp) Taylor River

qq) Taylor River (Lower)

rr) Tide Mill Creek

ss) Unnamed Brook to Bass Beach

tt) Upper Sagamore Creek

uu) Winnicut River

vv) Witch Creek

165. In addition, the 2018 List categorizes other areas as part of the Atlantic Ocean, and states that the following portions of the Atlantic Ocean are impaired by PCBs:

a) Atlantic Ocean (generally)

b) Bass Beach

c) Cable Beach

d) Chapel Brook

e) Eel Pond

f) Foss Beach

g) Hampton Beach State Park Beach

h) Jenness Beach

i) Little River

j) New Castle Beach

k) North Beach

l) Northside Park Beach

m) Parson's Creek

n) Rye Harbor

o) Sawyer Beach

p) Seabrook Town Beach

q) Seabrook Water Treatment Plant Outfall

r) Star Island Beach

s) Star Island Wastewater Treatment Facility Outfall

t) State Beach (North Hampton)

u) Sun Valley Beach

v) Wallis Sands Beach

w) Wallis Sands State Park Beach

x) Wallis Sands Wastewater Treatment Plant Outfall

166. The PCB contamination caused by Monsanto is an ongoing problem and the State continues to discover further PCB contamination of its natural resources to this day. Indeed, Country Pond, the Souhegan River, and Souhegan River-Goldman Dam were newly added to the State's 2018 List as impaired by PCBs.

167. In addition, since the 2018 List was published, the State has discovered significant PCB contamination in Squam Lake, the third-largest lake in New Hampshire (6,791 acres). For example, some 160 different PCB congeners were discovered in fish in Squam Lake, at

concentrations of over 20 parts per billion—prompting the State to issue an advisory to limit consumption of these fish, as discussed below.

168. The recent Squam Lake fish advisory is only part of a larger PCB problem there. PCBs have been found in loon eggs at Squam Lake at levels exceeding 10,000 parts per billion—well above the safe threshold. Loons are currently experiencing a nearly complete reproductive failure on Squam Lake, with only three chicks surviving in 2018, and only one chick surviving in 2017.

169. PCBs also have been found in loon eggs at some 20 other lakes in New Hampshire, including at Lake Winnipesaukee, Umbagog Lake, First Connecticut Lake, Lake Sunapee, Lake Francis, Merrymeeting Lake, and Canobie Lake. In most of these lakes, the contamination in eggs is in the thousands of parts per billion, well above the safe threshold. These lakes have a total surface area of tens of thousands of acres.

170. PCBs have been detected in sediments at multiple locations in the Squam Lake watershed. PCBs have also been found in sediment in many other water bodies throughout New Hampshire, including North Mill Pond, the Piscataqua River, Hampton/Seabrook Harbor, Upper Portsmouth Harbor, Spruce Creek, Salmon Falls River, and the Cocheco River.

171. PCBs contaminate an indeterminate number of other New Hampshire waterbodies and waterways at levels that have never risen to the impairment threshold. There are also many waters for which adequate PCB measures are not currently available and testing is needed in order to protect public health, natural resources and wildlife. The State has taken samples for PCB contamination in only a small fraction of the approximately 8,818 surface waters across New Hampshire. It is inevitable that additional sampling will uncover far more extensive PCB contamination.

172. Like New Hampshire waters, New Hampshire soils and air also suffer PCB contamination.

173. The State has expended time and money to assess, investigate, and monitor PCB contamination of its natural resources and throughout New Hampshire generally, and will spend time and money in the future to address this PCB contamination. The State has suffered impairment to property it owns outright or holds in trust, and New Hampshire residents have also lost certain uses of natural resources impaired by PCBs over many years, including the decimation of local loon populations and loss of fishing, as described further below. The cost of restoring these resources is substantial.

174. The foregoing allegations are not intended to limit the scope of this action to the specifically identified waterbodies or natural resources.

2. PCB fish advisories in New Hampshire.

175. The State has a duty to protect the public health, welfare, and well-being of New Hampshire residents, and to ensure that the State's environment and economy are not impaired. New Hampshire subsistence and recreational fishermen who catch and consume fish from New Hampshire waterbodies, and the related economy, have been adversely affected by fish consumption advisories resulting from PCB contamination. For example, the New Hampshire Department of Environmental Services ("NHDES") has specifically advised:

a) No one should eat more than two meals per month of any bluefish or striped bass caught in New Hampshire saltwater areas, due to excessive contamination by PCBs.

b) No one should consume any lobster tomalley, also because of PCB contamination.

c) No one should eat any fish from the portion of the Souhegan River between Riverway East and the Goldman Dam, due to excessive levels of PCBs.

d) For all fish in Squam Lake and Little Squam Lake except yellow perch: (i) adults and

children seven and older are limited to three fish meals per year; (ii) women of childbearing age are limited to two fish meals per year; and (iii) children below seven are limited to one fish meal every year. The limits are slightly higher for yellow perch: 12 meals per year for adults, six meals per year for women of childbearing age, and four meals per year for children under seven. This contamination was discovered only in 2019.

e) For large and smallmouth bass in the Country Pond, the limit is six meals per year. For all other fish from Country Pond, the limit is 12 meals per year for high risk groups, and 21 meals per year for lower risk groups.

176. In short, contamination of the State's waterbodies and aquatic life attributable to Monsanto's PCB products has for decades significantly curtailed the ability of New Hampshire residents to collect and consume local fish. This contamination will continue well into the future. This impairment harms New Hampshire subsistence and sport fishers, as well as the New Hampshire public and the State itself.

177. Further, the State has spent time and money to implement and educate the public about its PCB fishing advisories, none of which would have been necessary but for Monsanto's sale and dissemination of toxic PCB mixtures, which, when used as intended, would inevitably contaminate natural resources and endanger people, animals, and the environment.

3. Other PCB impacts in New Hampshire.

178. High levels of PCBs have been detected in seals, damaging the health of New Hampshire seal populations. Some 34 stranded or dead seals were discovered in New Hampshire in July and August 2018. Live seals have shown signs of lethargy and have had seizures. Monsanto's PCBs are at least partially responsible for these deaths, because PCBs make the seals susceptible to disease and toxins.

179. PCBs have also been detected in clams, oysters, and mussels in New Hampshire.

180. To battle PCB contamination of its natural resources, the State is engaging in cleanup of PCBs at various sites throughout the State. These include, by way of example only, the Kingsbury Corp. site in Keene and the Lavoie site in Berlin. The State has expended (and continues to expend) time and money addressing PCB contamination at these and other sites.

181. In addition to the damage to natural resources, the State and/or its subdivisions have spent monies to remediate PCBs in publicly-owned buildings, and many more buildings contain PCB contamination that has yet to be identified and removed. The PCB contamination in these buildings is due to the conduct by Monsanto set forth herein.

182. The State and its residents have suffered significant loss of use of New Hampshire's natural resources and loss of important ecosystem services. The State has also suffered loss of the value of property it owns and/or holds in trust, among other injuries attributable to Monsanto's conduct.

183. The PCB contamination in New Hampshire caused by Monsanto's conduct is ongoing and has not been corrected. Indeed, because Monsanto's PCBs are environmentally persistent, they continue to circulate in and impair natural resources and public property to this day.

FIRST CAUSE OF ACTION: NEGLIGENCE

184. The State repeats and restates the allegations set forth in all the previous paragraphs of this Complaint as if fully set forth herein.

185. Defendants had a duty to the State and the New Hampshire public to exercise due care in the design, manufacture, formulation, handling, control, disposal, promotion, marketing, distribution, sale, testing, labeling, use, provision of product information and instructions for the use and disposal of PCBs.

186. Defendants breached their duty of care in that they negligently, carelessly, and/or recklessly designed, manufactured, formulated, handled, labeled, provided product information and/or instructions for use and disposal of, marketed, promoted, sold, supplied and/or otherwise distributed PCB mixtures.

187. Defendants' breach of their duty of care caused PCBs to contaminate surface waters, sediment, fish, wildlife, marine resources and other natural resources in New Hampshire, as well as public buildings, thereby creating a threat to human health and the environment. This contamination would not have occurred but for the Defendants' breach of their duty of care, and Defendants' breach of their duty of care was a substantial factor in bringing about the injury to the State.

188. Defendants designed, manufactured, formulated, handled, labeled, provided product information and/or instructions for use and disposal of, marketed, promoted, sold, supplied and/or otherwise distributed PCB mixtures to downstream handlers even though it was foreseeable that Defendants' PCB mixtures, when used as intended, would contaminate sediment, surface waters, fish, wildlife, marine resources and other natural resources, as well as public buildings. This contamination threatens the health and welfare of the State's residents.

189. Despite their knowledge that contamination with PCBs was the inevitable consequence of their conduct as alleged herein, Defendants failed to provide reasonable warnings or special instructions, failed to take other reasonable precautionary measures to prevent or mitigate such contamination, and/or affirmatively misrepresented the hazards of PCBs in their product information and/or instructions for use.

190. As a direct and proximate result of the Defendants' acts and omissions as alleged herein, the State and its residents, which it represents *parens patriae* and as public trustee, have

suffered monetary losses and damages in amounts to be proven at trial. The Defendants' acts or omissions described herein were a substantial factor in bringing about these harms, and these harms would not have occurred without such acts or omissions.

191. Defendants are jointly and severally liable for the damages described above.

SECOND CAUSE OF ACTION: DESIGN DEFECT

192. The State repeats and restates the allegations set forth in all the previous paragraphs of this Complaint as if fully set forth herein.

193. Defendants' PCB mixtures and PCB-containing products were not reasonably safe as designed at the time they left Defendants' control.

194. Defendants' PCB mixtures' toxicity, tendency to bio-accumulate and bio-magnify, inability to be contained, and environmental persistence rendered them unreasonably dangerous at all times.

195. Defendants failed to inform users, consumers, intermediaries, the State, and any party that could have effectively reduced the risk of harm related to the use of Defendants' PCB mixtures of the products' character and the care required to use and dispose of the products safely.

196. At all times relevant to this action, Defendants' PCB mixtures were used in a manner in which they were foreseeably intended to be used.

197. As a direct and proximate result of the Defendants' acts and omissions as alleged herein, the State and its residents, which it represents *parens patriae*, have suffered monetary losses and damages in amounts to be proven at trial. The design defect described herein was a substantial factor in bringing about these harms, and these harms would not have occurred without the design defect.

198. As a further direct and proximate result of Defendants' conduct, the State, as property owner, public trustee and in its *parens patriae* capacity, has suffered and continues to

suffer damage from Defendants' conduct and from the presence of PCBs in New Hampshire surface waters, sediment, fish, wildlife, marine resources, other natural resources, and public buildings. These damages include without limitation costs to sample, assess, investigate, monitor, analyze, and remediate PCBs, to prevent PCBs from injuring additional public trust resources, and to restore or replace impacted surface waters, sediment, fish, wildlife, and marine resources whose use has been lost or degraded.

199. Defendants are strictly, jointly and severally liable for the damages described above.

THIRD CAUSE OF ACTION: FAILURE TO WARN

200. The State repeats and restates the allegations set forth in all the previous paragraphs of this Complaint as if fully set forth herein.

201. Defendants were in the business of designing, engineering, manufacturing, developing, marketing, and selling commercial PCB formulations and as such had a duty to provide reasonable instructions and adequate warnings about the environmental and health hazards posed by PCBs.

202. Products containing PCBs manufactured and/or supplied by Defendants are defective and unreasonably dangerous products.

203. Defendants failed to provide adequate or effective warnings of the risks of PCBs, and/or products containing PCBs, to users, consumers, intermediaries, the State, and any party that could have effectively reduced the risk of harm related to using Defendants' PCB mixtures. Defendants similarly failed to provide adequate or effective warnings of the products' character and the care required to use and dispose of the products safely. Defendants did not make the potential harmful consequences of PCBs apparent to the parties described above, and did not provide warnings of the significant risks and dangers caused by a failure to dispose of PCBs in a

safe manner. Any warnings that were provided were not of such intensity to cause a reasonable person to exercise caution equal to the potential danger.

204. PCB mixtures and/or products containing PCBs, manufactured and/or supplied by the Defendants were used in a manner in which they were foreseeably intended to be used.

205. As a direct and proximate result of the Defendants' acts and omissions as alleged herein, the State and its residents, which it represents *parens patriae,* have suffered monetary losses and damages in amounts to be proven at trial.

206. As a further direct and proximate result of Defendants' conduct, the State, as property owner, public trustee and in its *parens patriae* capacity, has suffered and continues to suffer damage from Defendants' conduct and from the presence of PCBs in New Hampshire surface waters, sediment, fish, wildlife, marine resources, other natural resources, and public buildings. These damages include without limitation costs to sample, assess, investigate, monitor, analyze, and remediate PCBs, to prevent PCBs from injuring additional public trust resources, and to restore or replace impacted surface waters, sediment, fish, wildlife, and marine resources whose use has been lost or degraded.

207. The failure to warn described herein was a substantial factor in bringing about these harms, and these harms would not have occurred without the failure to warn. Had Defendants given proper warnings, PCBs would not have been used or would have been used differently.

208. Defendants are strictly, jointly and severally liable for the damages described above.

FOURTH CAUSE OF ACTION: VIOLATION OF THE PUBLIC TRUST DOCTRINE

209. The State repeats and restates the allegations set forth in all the previous paragraphs of this Complaint as if fully set forth herein.

210. The State is the trustee of a public trust, the corpus of which includes, but is not limited to, the State's surface waters, sediment, fish, wildlife, marine resources and other natural resources.

211. As a direct and proximate result of Defendants' conduct, as set out above, the State's surface waters and sediment, fish, wildlife, marine resources and other natural resources have been contaminated and/or impaired by PCBs supplied and/or manufactured by the Defendants, and their beneficial uses and very existence have been degraded or eliminated.

212. As a further direct and proximate result of Defendants' conduct, the State, in its capacity as trustee, has suffered and continues to suffer damage from Defendants' conduct and from the presence of PCBs in the State's surface waters, sediment, fish, wildlife, marine resources and other natural resources. These damages include without limitation costs to assess, sample, investigate, monitor, analyze, and remediate PCBs, to prevent PCBs from injuring additional public trust resources, and to restore or replace the State's impacted surface waters, sediment, fish, wildlife, and marine resources whose use has been lost or degraded.

213. These injuries would not have occurred but for the Defendants' violation of the public trust doctrine, and Defendants' violation was a substantial factor in bringing about these injuries.

214. The foregoing conduct by Defendants constitutes an unreasonable interference with the use and enjoyment of public trust rights.

215. Defendants are jointly and severally liable for the damages described above.

FIFTH CAUSE OF ACTION: PUBLIC NUISANCE

216. The State repeats and restates the allegations set forth in all the previous paragraphs of this Complaint as if fully set forth herein.

217. The PCBs manufactured and/or supplied by the Defendants contaminate surface water, sediment, fish, wildlife, other natural resources, and public buildings in large areas of New Hampshire.

218. This PCB contamination has persisted to the present day, and constitutes a substantial and unreasonable interference with the health and convenience of the community and with other rights common to the general public.

219. This contamination is the direct and proximate result of the Defendants' acts and omissions as alleged herein. Defendants made, marketed, and sold PCB mixtures in New Hampshire, despite being substantially certain that this conduct would inevitably cause the harm described above, and without providing adequate warnings to users in New Hampshire that PCBs would inevitably enter the environment and cause permanent contamination. Unlike these end users of PCBs, Defendants possessed proprietary knowledge about PCBs' toxicity and propensity to cause this persistent contamination. Without Defendants' acts and omissions, the massive PCB contamination throughout New Hampshire would not have occurred, and Defendants' conduct was a substantial factor in bringing about these injuries.

220. This PCB contamination constitutes an injury to the public that is severe and greater than the public should be required to bear without compensation.

221. This public nuisance can be reasonably abated through enhanced stormwater management techniques, bioretention and wetlands construction, green streets and green roofs initiatives, enhanced street sweeping, upgraded stormwater and wastewater infrastructure, and other systematic techniques for intercepting PCBs in stormwater and wastewater, as well as comprehensive source identification and control techniques to locate, monitor, and reduce or control PCB emissions and to treat particular legacy applications of PCBs still in existence in New

Hampshire. This public nuisance can also be reasonably abated through targeted cleanups of contaminated sediment, and measures to reduce ongoing drainage of PCBs into the environment. Such abatement measures are costly and should not be borne by the State and its residents.

222. Defendants are jointly and severally liable for the damages described above.

SIXTH CAUSE OF ACTION: TRESPASS

223. The State repeats and restates the allegations set forth in all the previous paragraphs of this Complaint as if fully set forth herein.

224. The PCBs manufactured and/or supplied by the Defendants contaminate the State's property and its sediment, surface waters, fish, wildlife, marine resources, other natural resources, and public buildings. This contamination constitutes a physical invasion of property without permission or license.

225. The trespass of PCBs has varied over time and has not ceased. PCBs manufactured and/or supplied by the Defendants continue to be located on or in the State's property and its sediment, surface water, fish, wildlife, marine resources, other natural resources, and public buildings.

226. Defendants intended to manufacture PCBs and products that contain PCBs. The Defendants knew with substantial certainty that their acts would contaminate the State's property and its surface waters and sediment, fish, wildlife, marine resources, other natural resources and public buildings. Specifically, Defendants sold PCB mixtures for use in products (such as paper and paint) and Defendants knew with substantial certainty that PCBs would escape from these products and leach into the environment, and that these PCBs would not and could not be properly disposed of by end users in New Hampshire. Defendants knew with substantial certainty that their conduct would cause PCB contamination in New Hampshire, regardless of any precautions taken by end users.

227. The State has not consented to and does not consent to the trespass alleged herein.

228. These injuries would not have occurred but for the Defendants' trespasses, which were a substantial factor in bringing about these injuries.

229. Defendants are therefore liable for trespass and continued trespass.

230. The State brings this claim as the owner of property and interests in property, as well as in both its public trustee and *parens patriae* capacities. PCBs have invaded a substantial number of its residents' possessory interests in the State's natural resources and public buildings. As long as the State's property, natural resources and public buildings remain contaminated due to Defendants' conduct, the trespass continues. As a direct and proximate result of the Defendants' acts and omissions as alleged herein, the State and its populace, which it represents *parens patriae*, have suffered monetary losses and damages in amounts to be proven at trial.

231. Defendants are jointly and severally liable for the damages described above.

PRAYER FOR RELIEF

WHEREFORE, the State requests that this Honorable Court enter judgment against Defendants as follows:

A. Damages according to proof, including damages for injury to New Hampshire surface water, sediment, fish wildlife, marine resources, other natural resources, and public buildings, including the economic impact to the State and its residents from loss of use, value, benefits, or ecological services, or other injuries resulting from the conduct alleged herein;

B. An award of past, present, and future costs to investigate, assess, analyze, monitor, and remediate the contamination, including the cost of a sampling program to determine the full extent of PCB contamination in surface water, sediment, fish wildlife, marine resources, other natural resources and public buildings within New Hampshire;

C. Any other damages, including enhanced compensatory damages based on conduct by Defendants that was intentional, wanton, malicious, and/or oppressive;

D. A judicial determination that each Defendant is liable for future costs related to the investigation, remediation and removal of PCBs from New Hampshire surface water, sediment, fish, wildlife, marine resources, other natural resources, and public buildings;

E. Litigation costs and attorneys' fees as permitted by law;

F. Pre-judgment and post-judgment interest on all monies awarded, as permitted by law; and

G. Such other and further relief as the Court deems just and proper.

DEMAND FOR JURY TRIAL

The State seeks a trial by jury on all counts and requests for relief in this Complaint.

Date: October 27, 2020

THE STATE OF NEW HAMPSHIRE

MERRIMACK, SS. SUPERIOR COURT

STATE OF NEW HAMPSHIRE,

Plaintiff,

vs.

MONSANTO CO.,
SOLUTIA, INC., and
PHARMACIA LLC,

Defendants.

Exhibits to Complaint
Table of Contents

EXHIBIT 1

October 11, 1937.

"Experimental work in animals shows that prolonged exposure to Aroclor vapors evolved at high temperatures or by repeated oral ingestion will lead to systemic toxic effects.

Repeated bodily contact with the liquid Aroclors may lead to an acne-form skin eruption.

Suitable draft ventilation to control the vapors evolved at elevated temperatures, as well as protection by suitable garments from extensive bodily contact with the liquid Aroclors, should prevent any untoward effect."

In talking with Dr. Kelly before these three paragraphs were written, we agreed that they might as well be phrased so that they could be used not only in the Aroclor booklet, but quoted in correspondence as that may be necessary.

I. EXPERIMENTS TO DETERMINE THE POSSIBLE TOXICITY OF THE FOLLOWING SUBSTANCES

1. CHLOROCOSANE

On July 14, 1937, we were informed by F. D. Smith that each 6 ounce bottle of a soft drink might contain 60 to 70 mgm. of chlorocosane. There was no pharmacological reason to believe the compound would be irritating or toxic in any way, and therefore it was decided to dose rats with it very heavily, the argument being that if they survived heavy dosage without any evidence of damage a verdict of no toxicity might be given and much time saved. If, on the other hand, the large doses proved poisonous it would be necessary to reduce dosage until a non-toxic level was reached. The first of these alternatives proved correct.

Experiments. -- August 10, 1937. 20 adult white rats ranging in weight from 162 to 210 gm. were each fed 70 mgm. of chlorocosane in 1 cc. of olive oil daily by stomach tube. These animals showed no evidence of damage in any way attributable to chlorocosane. They were examined microscopically from the 35th to the 92nd day. The only constant change observed was a possible slight increase in the granularity of the cells of the liver cords, but the pathologist in charge felt this to be within normal limits. This finding is doubly reassuring since many of the animals developed a chronic suppurative lung condition very prevalent in Boston stock rats at the time. But even with this added handicap there was no evidence of damage and we thus conclude that chlorocosane even in enormous dosage is an inert material in the body and in all probability passes through the intestine unchanged.

2. DIPHENYL PHTHALATE

On August 23, 1937, we were informed by Dr. R. E. Kelly that diphenyl phthalate might be absorbed through the skin or might be inhaled and swallowed during spraying operations. After consultation it was decided to feed heavily, and if there were indications of toxicity to project other experiments.

Experiments. -- September 20, 1937. 20 adult white rats ranging in weight from 242 to 301 gm. were each fed 0.5 mgm. of diphenyl phthalate suspended in 1 cc. of water by stomach tube daily. The animals were from new stock and with one exception remained clear of the lung condition which existed in the chlorocoame group. During the period of experiment, which lasted 92 days, practically all the animals gained weight. Examination of 8 animals killed at intervals during this period of test resulted as follows:

The organs were normal grossly, and on microscopic examination the liver alone was of possible interest. The changes in the liver varied from those in which the cells of the liver cords were almost normal, having only a slight swelling and granularity of their cytoplasm, to those in which these changes were pronounced. In the latter there was a moderate degree of vacuolization and a rare hyaline body. These alterations it must be understood were the result of very certain dosage, since the compound was given by stomach tube and the animals had no possible way of avoiding it. Neither the pathologist nor myself was able to consider them of enough moment to cause us to make further experiments.

I am confident that with the ordinary precautions accompanying spray lacquering no possible harm could be done, even if the concentration of diphenyl phthalate in the lacquer was far above the 5 per cent figure given us by R. E. Kelly.

8. CHLORINATED DIPHENYL -- COMPOUND #1268

This material was furnished by the Monsanto Chemical Company. It was said to have a chlorine content of 68 per cent, the highest chlorine figure of any compound tested by us during the past three years. It had been our impression that toxicity and chlorine content followed one another closely, but this has not turned out to be the case for #1268. Further discussion of this point will follow the description of the experimental observations and their results.

Experiments. -- August 2, 1937. The compound #1268 was administered by inhalation, the technique being that described in the paper entitled The Problem of Possible Systemic Effects from Certain Chlorinated Hydrocarbons, Journal of Industrial Hygiene, 1937, 19, 283. For the first observations 80 adult white rats were used. They were exposed as follows:

Group 1. -- 80 animals. Temperature to which the compound was heated to introduce fume into air line 140-190° C. Average concentration in air breathed by rats 0.53 mgm. per cubic meter. Average daily exposure 16 hours. The experiment was continued for 119 days, animals being sacrificed at intervals for pathological examination and for the carbon tetrachloride and alcohol test (see paper previously cited).

The conditions described above caused swelling and increase of granularity of the liver cells. Hyaline inclusions were rare. These changes were quite uniform in all animals examined after the 51st day, but were not certainly progressive. The rats were very healthy throughout the period and there was an almost uniform gain in weight. The carbon tetrachloride-alcohol test was positive after 52 days, which indicates that though liver damage was apparently slight some degree of harm had been done the organ. There was no evidence of

damage in any part of the body except the liver.

At the end of 93 days 10 rats, apparently in excellent condition, were removed from the experiment and set aside for observations upon liver recovery. These recovery animals showed no clinical changes of any sort. When sacrificed 72 and 141 days after removal from exposure it was observed that the swelling of the liver cells had disappeared, but the granular and hyaline material remained in the liver cells and had apparently become permanent. There was absolutely no progression of damage after removal from exposure.

These changes may be compared with those produced in rats by inhalation of chlorinated diphenyl #4465, administered in a similar manner in concentrations of 0.57 to 0.93 mgs. per cubic meter over similar periods of time. In the case of this compound the conspicuous difference was the far greater incidence of hyalinization of the liver cells, which in our opinion was the characteristic lesion caused by #4465 and mixtures containing it. One can therefore conclude that #1268 in low concentrations is definitely less toxic than #4465.

Group 2. — After 119 days, the low concentration of #1268 having proved but slightly poisonous, it was decided to increase the concentration in the air breathed by the 54 rats then remaining. Temperature and other conditions were maintained as during the first 119 days, but by the use of 4 vaporizers instead of 1 the average concentration of #1268 in the air was brought to 6.23 mgs. per cubic meter of air. Exposure to this very high concentration was continued for 87 days.

Under these extreme conditions the animals again remained in perfect health. The carbon tetrachloride and alcohol test was positive but there was absolutely no other indication of liver damage and no evidence of disturbance to other organs.

When examined at autopsy at the end of 87 days -- the animals had experienced a total exposure of 206 days -- there were no gross evidences of abnormality in any part. On microscopic examination no organ showed changes except the liver. The number of cells containing hyaline and the amount of hyaline in the cells involved increased during this period of exposure to the higher concentration of #1268. The hyaline was most abundant in the portal zone of the lobule with very little in the central area. After 42 days of exposure 10 rats were set aside and were sacrificed 73 days later. They were in excellent condition when removed and did not change. Grossly, at autopsy, they showed nothing abnormal, and on microscopic examination the liver cells had lost their swelling but retained increased granularity and hyaline inclusions.

The experiments on inhalations of high concentrations of #1268 reenforce the conclusion that this compound is of low toxicity as compared with #1465 or with chlorinated naphthalenes above trichlornaphthalene. The question as to why #1268, the most highly chlorinated compound tested, proved but slightly harmful cannot be answered with any definiteness. It has been suggested that the toxicity of all these chlorinated compounds, even though of varied composition, may depend on the ability of the animal to decompose them after lodgment in the tissues, and that this decomposition might be shown by an increase in the chlorine in the urine in suitably conducted feeding experiments. In experiments upon this point we have shown a definite increase in the urinary chlorides when dogs and rats were fed a mixture of penta and hexachloronaphthalenes (#1000), a compound highly injurious to the liver and containing 62.6 per cent of chlorine, but similar observations have not been made with any of the chlorinated diphenyls or allied compounds. It may, however, be that when about 65 per cent chlorination is reached the substances formed are quite stable in the body and so cause a minimum of damage.

In conclusion, #1268, if handled with ordinary precautions as to ventilation should be entirely harmless to workmen. While it cannot be given an absolutely clean bill as to health, it is preferable to #4465 and #5460.

4. MIXTURE OF CHLORINATED DIPHENYL AND CHLORINATED DIPHENYL BENZENE -- COMPOUND #5460

This substance was furnished by the Monsanto Chemical Company and was said to have a chlorine content of 60 per cent, being in this respect below #4465 and far below #1268.

Experiments. -- The inhalation technique was used as in the case of #1268 and #4465.

August 2, 1937. 80 adult white rats were the subjects. Temperature to which the compound was heated to introduce fume into the air line 140-155° C. Average concentration in air breathed by rats 0.085 mgm. per cubic meter. Average daily exposure 16 hours. The experiment lasted 119 days. A certain number of animals were sacrificed for pathological examination, others were used for the carbon tetrachloride and alcohol test, and still others set aside for observations as to recovery from possible damage.

In spite of the fact that the concentration in the air breathed by the rats averaged about 1/6 that obtained at comparable temperatures from #1268, a number of these animals became sick and lost weight towards the end of the second month of exposure. When killed, such individuals showed gross mottling of the liver but no changes in other organs. On microscopic examination swelling of the liver cells, increased granularity and hyaline inclusions were noted in animals killed as early as the 16th day of exposure. These changes obviously occurred rapidly. Hyaline deposits were never as numerous as with #1268. Animals

removed for recovery after 51 and 119 days of exposure did not gain markedly in weight, and one died for no obvious cause. When examined at autopsy the swelling of the liver cells had subsided, but abnormal granularity and hyalinization remained.

Needless to say the carbon tetrachloride and alcohol test was positive whenever used.

In view of the fact that #5460 in such low concentration proved so definitely toxic, no higher concentrations were tested. It seems imperative that whenever this compound is used in industry, great care be taken to keep concentrations in the air at an extremely low level. No liberties can be taken with it, as with #1268.

II. SOME GENERAL CONSIDERATIONS

In addition to these tests of compounds, certain experiments were done which are of interest to those manufacturing or using chlorinated hydrocarbons. Details as to these experiments are of course available but are not included in this report since they are not of direct industrial interest.

1. EVIDENCE FOR THE DESTRUCTION OF A MIXTURE OF PENTA AND HEXACHLORNAPHTHALENES (#1006) IN THE BODY

It has always been a question as to whether the chlorinated hydrocarbons which have been examined by ourselves and by others do harm per se or whether toxicity depends on their breakdown in the body with the liberation of something harmful to the liver. A partial answer has been obtained by feeding #1006 to rats and dogs which were on a low chloride diet with uniform excretion of chlorides in the urine. When these animals received the chlorinated hydrocarbon (#1006) the urinary chlorides rose. This indicates that the body certainly has power to detach chlorine from this compound, and it is probable that the same condition is true for allied toxic compounds. It would be most interesting to see whether ingestion of #1268 results in similar findings or whether in the case of this relatively non-toxic compound there is practically no splitting off of chlorine. Neither time nor our financial resources permitted such tests.

2. THE EFFECT OF INCREASING THE SODIUM CHLORIDE IN THE DIET UPON ANIMALS RECEIVING TOXIC DOSES OF #1006

On the ground that chlorides might be fundamentally associated with toxicity, a group of 15 rats was fed a low toxic dose of #1006 and compared with a similar group on the same dosage of #1006 plus a marked increase in chloride intake secured by giving 5 cc. per kilogram of body weight of 4 per cent NaCl solution daily.

No differences were found between the two groups, and it may be concluded that chlorine increase secured through the diet does not enhance toxicity. This experiment was done in order to find out whether increase in chloride intake during hot weather might be harmful.

A particular phase of the problem, the possible enhancement of typical skin lesions by increasing chloride intake, cannot be decided by experiments on fur-bearing animals with no sebaceous glands. All that can be said at the moment is that increased chloride intake does not increase systemic toxicity.

3. THE EFFECT OF HIGH AND LOW CALCIUM DIETS ON ANIMALS RECEIVING HIGH CONCENTRATIONS OF #1006

It is well known that a diet rich in calcium is markedly effective in preventing the acute yellow atrophy of the liver produced by carbon tetrachloride (The Prevention and Treatment of Carbon Tetrachloride Intoxication. By P. D. Lamson, M.D., A. S. Minot, M.D., and D. H. Robbins, M.S., Journal of the American Medical Association, 1928, volume 90, page 345).

To discover whether calcium in the diet would protect against liver damage

from a toxic chlorinated hydrocarbon, 30 adult white rats were placed upon a diet of lean horsemeat, starch and lard, a combination adequate for maintenance but very low in calcium. Another group was given a diet consisting of dog chow, milk, lettuce and eggs, with added calcium lactate -- a ration very high in calcium.

Both groups were exposed simultaneously to inhalation of high concentrations of #1006, an average of 11.21 mgm. per cubic meter for 16 hours a day.

After 16 days, 12 high calcium diet rats were alive and 7 of the low calcium group. At intervals animals were killed for examination. In both groups the liver was abnormal grossly and microscopically, and in both groups animals died from liver damage. It was impossible to consider that the high calcium diet was in the least degree protective. It may, therefore, be concluded that adding calcium to the diet of workers either in the form of extra milk or of calcium lactate will not prevent liver damage.

4. THE EFFECT OF INJECTIONS OF XANTHINE ON ANIMALS INHALING HIGH CONCENTRATIONS OF #1006

In 1937, R. C. Neale published a brief paper (The Protective Action of Certain Purines against Liver Necrosis Produced by Carbon Tetrachloride and Chloroform. Science, 1937, volume 86, page 86). He claimed that rats injected with sodium xanthine became markedly resistant to carbon tetrachloride. This suggested that xanthine might have similar protective power over liver damage from the chlorinated hydrocarbons on examination in this laboratory.

Accordingly 36 adult white rats were caused to inhale #1006 in concentrations averaging 15 mgm. per cubic meter for 16 hours daily. One group of 20 rats was given 20 mgm. of xanthine subcutaneously every other day and 40 mgm.

of xanthine by stomach tube on the alternate days. The second group of 18 rats had the same exposure to #1006 without xanthine treatment. No differences were noted and one cannot expect any efficacy from xanthine either in the prevention or treatment of liver disease due to this chlorinated hydrocarbon, and in all probability the same negative result would be encountered in connection with allied toxic compounds.

Dr. Louis W. Spolyar, Director
Division of Industrial Hygiene
Indiana State Board of Health
1098 West Michigan Street
Indianapolis 7, Indiana

Dear Dr. Spolyar:

I enclose an application bulletin on our Aroclors. On page 19, there is a summary of almost all our toxicology information on this compound.

If the case you refer to is in Brazil, Indiana, our company has had some contact with the problem. This particular installation used a temporary heat transfer system, and thus did not make the installation air tight. This is contrary to our expressed instructions when Aroclor is to be used at elevated temperatures. Upon hearing of the illness, one of our development engineers went to the plant and gave his recommendations, and then I called the plant physician to try to obtain some idea of what the illnesses were. As far as I could determine, two men suffered from gastrointestinal upset. I suspected the possibility that the Aroclor fumes might have caused liver damage, but was unable to obtain this information over the phone. I was also unable to contact the employee's physician.

The toxicology of Aroclors is somewhat confused. The experimental work was done by Dr. Drinker at Harvard about 12 years ago, and was done in connection with chlorinated naphthylene, chlorinated diphenyl, and chlorinated diphenyl high boiler. Both of these last two are Aroclors. In the particular work at Harvard, Dr. Drinker found that Aroclor 1268, which means diphenyl chlorinated to 68%, was of low toxicity. The confusion existed in his findings that Aroclor 1254, which is the diphenyl chlorinated to only 54%, was considerably more toxic on inhalation. We did not supply him with this material, and I was never convinced that some error might not have been made in the sample.

At any rate, we have advised protection against all Aroclor fumes when an elevated temperature is used. I will appreciate it if you will let me know the result of your investigation, if one is to be made.

Very truly yours

R. Emmet Kelly, M.D.
Medical Director

Subject AROCLORS: TOXICITY

cc Mr. T.K. Smith - 7
Mr. A.T. Beauregard - 7
Mr. P. O. Benignus - 7
Dr. J.W. Barrett - London
Dr. J.A. Gardner,- Fulmer
Mr. J.F. Stickley - KXOK
Dr. N.B. Dyson - Newport

Mr. Beauregard has asked the Medical Department to comment on your letter referred to above.

As I am sure you know, Aroclors cannot be considered nontoxic. The interpretation of the toxic properties of a compound, however, determine whether or not there is any hazard associated with the specific use of a compound. To my knowledge, there is no hazard involved in the use of transformers containing Aroclors as a substitute for other materials. To my understanding, in the United States this application of Aroclors is widely accepted and has not resulted in any difficulty from a toxicological standpoint.

I cannot state whether or not a flash discharge might generate phosgene. I believe, however, that any phosgene so generated would be in a very small proportion to the total smoke and fumes resulting from the discharges. In instances where Aroclor, as a heat exchange medium, has been subjected to fire and high temperature after a leak in equipment, the clouds of breakdown products have been highly irritating but probably no more so than one would expect from the burning of any type of industrial oil or chemical.

I'm sure that Mr. Benignus will answer your questions relative to the effect of Aroclor on insulating materials, when he returns from his vacation next week.

As you indicated, we are watching the use of the Aroclors as plasticizers in emulsion paints. We do not recommend that they be used in paints which might be applied in confined or unventilated areas, particularly if the paints might be used on heated surfaces. As you stated, this is a case of worrying about the exposure of painters who might apply such materials day in and day out rather than the worrying about those who might occupy the room during or shortly after the paint has been applied.

September 20, 1955

Dr. J.W. Barrett

London

Your memo September 8 to Mr. Nason

AROCLOR TOXICITY

Howard Nason has given me your memo of September 8. I will be happy to discuss this with Dr. Newman during his visit here. I think, however, there are several points that I can answer you now.

You comment upon the difference in toxicity between Aroclor 1254 and 1242. This is not particularly surprising because in the earlier work it was found that toxicity increased with chlorination. Of course, from the standpoint of volatility in the case of inhalation or absorption from the gut from the point of view of ingestion are important. Frankly, there was not too great a difference between the two compounds, however. As you know, the maximum allowable concentrate is 0.1 ml/cubic meter in the case of 1254, and as high as 10.0 mgm in the case of 1268. I think the former is too low and the latter is too high. In this country they don't use the MACs very routinely, but certainly in England I think it would be alright to consider 0.2 mgm/cubic meter as perfectly safe.

I don't know how you would get any particular advantage in doing more work. What is it that you want to prove? I believe your work should be directed towards finding out what the concentrations are of Aroclor during different operations whether it is industrial or painting. The reports you have seen from Kettering Laboratory are the result of approximately $15,000 to $20,000 expenditure by MCC.

MCC's position can be summarized in this fashion. We know Aroclors are toxic but the actual limit has not been precisely defined. It does not make too much difference, it seems to me, because our main worry is what will happen if an individual developes any type of liver disease and gives a history of Aroclor exposure. I am sure the juries would not pay a great deal of attention to MACs.

COPY

We, therefore, review every new Aroclor use from this point of view. If it is an industrial application where we can get air concentrations and have some reasonable expectation that the air concentrations will stay the same, we are much more liberal in the use of Aroclor. If, however, it is distributed to householders where it can be used in almost any shape and form and we are never able to know how much of the concentration they are exposed to, we are much more strict. No amount of toxicity testing will obviate this last dilemma and therefore I do not believe any more testing would be justified.

Let's see what our discussions with Dr. Newman and yourself bring out.

R. Emmet Kelly, M.D.

At Krummrich Plant

Subject DEPARTMENT 246 (AROCLORS)

cc Mr. J. Cresce -Krumm. Plt
Mr. E. W. Lieben -" "
Mr. R. M. Webber -" "

It is the opinion of the Medical Department that the eating of lunches should not be allowed in this department for a number of reasons.

(1) Aroclor vapors and other process vapors could contaminate the lunches unless they were properly protected.

(2) When working with this material, the chance of contaminating hands and subsequently contaminating the food is a definite possiblity.

(3) It has long been the opinion of the Medical Department that eating in process departments is a potentially hazardous procedure that could lead to serious difficulties. While the Aroclors are not particularly hazardous from our own experience, this is a difficult problem to define because early literature work claimed that chlorinated biphenyls were quite toxic materials by ingestion or inhalation. In any case where a workman claimed physical harm from any contaminated food, it would be extremely difficult on the basis of past literature reports to counter such claims.

FYDRAUL 150

Dr. Treon and I spent an afternoon with the Navy people to discuss Fydraul 150. Those present were Captain Shone, Captain Alvis, Captain Sessions, Commander Siegal and Mr. Mickey Albert. They discussed their information concerning Fydraul 150 which was obtained at the Naval Institute of Medical Research. While reports were not available, they had the following general data:

Skin applications of Fydraul 150 caused death in all of the rabbits tested. (The amount administered was not given.) A like amount of Cellulube 220 did not cause any deaths.

The inhalation of 10 milligrams of Fydraul 150 per cubic meter or approximately 2 tenths of a part of the Aroclor component per million for 24 hours a day for 30 days caused, statistically, definite liver damage. No matter how we discussed the situation, it was impossible to change their thinking that Fydraul 150 is just too toxic for use in a submarine. It may be that such concentrations would never be reached in the submarine but the Navy does not appear willing to even put the material in a trial run to see if it will work.

It would appear, therefore, that we should discontinue to sell Fydraul 150 for this particular application and try to develop a hydraulic fluid without Aroclor as one of its components. In this connection, Cellulube 220 is not used in a submarine but it was used in this test merely as a yardstick.

The Navy said they did not have any competitive fluid far enough along engineering-wise to even consider the toxicity of it.

R. Emmet Kelly, M.D.

Risebrough in a recent paper "Nature", Vol. 220, Dec. 14, 1968, has attacked chlorinated biphenyls in three ways:

(1) a pollutant - widely spread by air-water; therefore an uncontrollable pollutant.

(2) a toxic substance - with no permissible allowable levels causing extinction of peregrine falcon by induced hepatic enzymes which degrade steroids upsetting Ca metabolism leading to reproductive weakness, presumably through thinner egg shells.

(3) a toxic substance endangering man himself; implying that the peregrine falcon is a leading indicator of things to come.

As outlined in Science, Vol. 163, Pg. 548, Environmental Defense Fund (EDF) is attempting to write new legal precedents in conservation law by hearings and court action. In the Wisconsin case, water quality standards are at issue. "A substance shall be regarded as a pollutant if its use results in public health problems or in acute or chronic (injury) to animal, plant or aquatic life". Wisconsin is one of 7 states which now have federally approved water quality standards. According to Bern Wright, acting chief of the Federal Water Pollution Control Administration's Water Quality Standards Branch, DDT would fit the definition of a pollutant upon a showing that it is harmful to aquatic life.

These people in EDF are saying we must not put stress on any living thing through a change in air or water environment. Eagles, plant life, anything which lives or breathes. This group is pushing hard on the extension of the word harmful. They claim "enzyme inducer" activity is the real threat of DDT and PCB's and are using these arguments to prove that very small amounts of chlorinated hydrocarbons are "harmful".

Monsanto is preparing to challenge certain aspects of this problem but we are not prepared to defend against all of the accusations.

(a) Monsanto is preparing itself to identify trace ppb quantities of chlorinated biphenyls in water samples, in concentrated collected air samples, and in animal tissues. We will know whether we have been falsely identified and accused or not. We will eventually know where any pollution is taking place and the extent of the pollution.

MONS 096509

(b) We are not prepared to defend ourselves against the accusations made of enzyme and hormone activity, the isolation of enzymes or metabolic products, the indirect accusation of cancer, or the splitting of genes, when this accusation is made. Whether we can defend this route or not needs further discussion.

(c) Through the Industrial Bio-Test program we are to establish the long term allowable limits of chlorinated biphenyls for certain birds-fish-animals by feeding experiments, pathological examination, and tissue analysis for chlorinated biphenyls. We may be able to answer reproductive ability in some animals.

DDT has been under attack for some years because of its chlorine content, its persistent ability to be identified, and the wildlife problems attributed to it. We will still be under the same attack by the mechanisms listed in (b) even though we might establish safe operating limits for humans and certain animals.

Where does this leave us?

Under identification and control of exposure - we will be able to identify and analyze residues as well or better than anyone in the world. We will probably find residues other than DDT and PCB's. We will probably wind up sharing the blame in the ppm to ppb concentration level.

We can take steps to minimize pollution from our own chlorinated biphenyl plants, we can work with our larger customers to minimize pollution, we can continue to set up disposal and reclaim operations. We can work for minimum exposure in manufacture and disposal of capacitors, transformers and heat transfer systems, and minimize losses for large hydraulic users.

But, we can't easily control hydraulic fluid losses in small plants. It will be still more difficult to control other end uses such as cutting oils, adhesives, plastics and NCR paper. In these applications exposure to consumers is greater and the disposal problem becomes complex. If chlorinated biphenyl is shown to have some long term enzyme or hormone activity in the ppm range, the applications with consumer exposure would cause difficulty.

Risebrough has taken known Aroclor samples and claims to have evidence of enzyme and hormone change. Here there is no question of identification. Either his position is attacked and discounted or we will eventually have to withdraw product from end uses which have exposure problems. Since Risebrough's paper in "Nature", Dec. 1968 has just been published, it is timely, perhaps imperative, that this paper and its implications be discussed with certain customers. This is a rough one because it could mean loss of business on empty and false claims by Risebrough.

Well prepared discussions with Ind. Bio-Test, Monsanto biochemists, the medical and legal departments must take place now. The

position of DDT manufacturers should be determined as a guide. We are being accused of the same things attributed to DDT.

I have written this memo to clarify some of the issues. May I please have comments.

Thanks,

W. R. Richard

SUBJECT DEFENSE OF AROCLOR - F. FLUIDS

REFERENCE

TO : E. Wheeler - EWHEE

cc P. Hodges PHODG
M. Farrar Res. 1
H. Bergen HBERG

General Policy

Make the Govt., States and Universities prove their case, but avoid as much confrontation as possible. Comply and work with public officials to meet or exceed requirements ahead of time. Adverse publicity and competition are the real weapons.

Analytical for Aroclor { In Air - Which Aroclors are present? Where? / In Water - Which compounds interfere? / In Animals } Govt. Agencie

Keep track of how much contamination - which sources.

Prove Bioharmful - Let Govt. prove its case, on case by case basis

Monsanto Visit-Govt. Biolabs - in search of toxicological experiments and evidence vs. Aroclors to keep up with progress.

Monsanto Prove Bioharmless - Limited work at Ind. Bio-test -

"Safe" toxic level for { man / mammals via / fish } { Rats / Chickens / Fish }

Seek evidence of Biodegradation
Question evidence against us.
Question shrimp toxicology especially other toxic chemicals.
If Aroclor bad, others must be worse.

Probable Outcome

We can prove some things are OK at low concentration. Give Monsanto some defense.

We can't defend vs. everything. Some animals or fish or insects will be harmed.

Aroclor degradation rate will be slow. Tough to defend against. Higher chlorination compounds will be worse than lower chlorine compounds.

Therefore we will have to restrict uses and clean-up as much as we can, starting immediately.

DSW 014256

Therefore we will have to work for alternate products in end use applications; for Aroclor production facilities.

Clean Up Aroclors and substitute products where necessary and when required, before threats of publicity and competitive activity overwhelm us.

Water Pollution seems to be first issue

Aroclor product is refractive, will settle out on solids - sewerage sludge - river bottoms, and apparently has a long life.

Florida or Gulf Coast - Aroclor 1254 - Aroclor 1260 present issue.

40-200 ppb - causing problem at Pensacola (Monsanto) in plant effluent-causing " with shrimp.
- can't risk shut-down of plant.

Federal and State can extrapolate to other plants in Gulf area.

San Francisco - Aroclor 1254 and 1260

Reported Aroclor to be present in San Francisco Bay.

Reported to be thin egg shells in birds -

Lot of screaming -

Great Lakes Warf studies on DDT

Aroclor 1254 will be found!

Aroclor 1242 will be found?

Air Pollution - Possible spread - but less of an issue right now.
Analytical work more difficult.

Direct Contact with Product

Doesn't seem to be an issue - except for food heat transfer.

We don't believe Aroclor is being used as carrier for insecticide - sprayed around -

We are not positive but most uses are "closed" systems or products used in solid plastics, or adhesives, or sealants.

DSM 014257

F. Fluids	Possible Pollution by Customers Plant Operation	Possible Pollut... by Customers Pro...
Product		
Hydraulic Fluids	Yes, leakage external	Possible - See Johnson Motors Castings.
Air Compressor Fluids	Yes, leakage external	Leakage into produ...
Heat Transfer	Yes, leakage external	Leakage into produ...
Capacitor Fluids	Yes, leakage from plant - Scrap materials.	In product but closed for end use
Transformer Fluids	No, Should be clean. Yes, Reworked transformers	In product but closed for end use

* Capacitors can go to land fill dumps. Probably not burned, in Al containers.

** Need to take care of Aroclor in discarded transformers. Product could be drained and reworked.

Probable Conclusions

Hydraulic Leakage - Product could be caught at machines but will take a lot of clean-up work with customers. - Will have to have replacement product - with less-sensitive components. Work from this base on clean-up to prevent more pollution problems.

Air Compressor Fluids "

Hydraulic Fluids Must expect "shrimp" experiments, West Florida State, to be "aired" sometime soon; next few months.

This will lead to bad publicity and competitive action vs. all Pydrauls.

We will have to try to confine to Aroclor 1254 and Aroclor 1260.

DSW 014258

We will have to take action before that time.

Gulf Coast -

Action W. Richard	Be able to replace Aroclor 1254 and Aroclor 1260 in Pydraul AC and 625 in 2 month's time before Nov. 15, 1969.
Fallon/ Richard	Have trial product in hands of Gulf Coast accounts and distributor before Dec. 15.
Fallon	Suggest possible buy of "all phosphate" ester from Food Machinery. Use this as one trial fluid MCS___ for insurance.
Richard/	Suggest possible substitution of Aroclor 5442 for Aroclor 1254 in hydraulic and compressor blends. E. Wheeler judges lower order of toxicity and solubility for 5442 series. Have to test product in pump test for deposits.
Fallon/ Richard	Suggest field trials of our own all-phosphate ester.
Fallon/ Kuhn/ Kountz	Work with large customers to clean-up streams. Bring in Findett as mfg. partner in the recycle business. Get money out of recycle operations.

Inland-Waterways-

Wheeler/ Richard	Be close enough to Great Lakes studies to judge situation. Are there animals which are being affected by the concentrations found?
Richard	Be prepared to replace Aroclor 1254 and Aroclor 1260 in 4 months in hydraulic fluids and in air compressor fluids.
Richard	Be prepared to replace all Aroclor 1242 or 1248 in 6 months in hydraulic fluids. This means replacement of Pydraul 312 series, and control of sale of Aroclor 1248 to other hydraulic accounts such as Cities Service and Mobil.

DSW 014259

Heat Transfer

Fallon/ Roush/ Kountz	Systems will have some leakage depending strongly on engineering and maintenance. Need to work with customers on clean-up.
Fallon/ Roush	Need to replace FR especially in food or sensitive product areas where the product is getting into water. See dish washer compounds. See letter E. Wheeler to T. Fallon.

We have possible replacement products in Therminol 55.
Therminol 66.

Action	
Kuhn	Try to assure adequate production of Therminol 66 in face of decreased Aroclor production. H_2 and terphenyl supply may become short. Switch customers to Therminol 55 or Therminol 66 ahead of pollution problems in customers plant. Work with customers on plant and dumping practices.
Kuhn/ Fallon	Findett already set up to rework. Need to make them a manufacturing arm. We get sale of recycle-rework fluid.

Capacitor Fluids	Capacitor products
Capacitor plants have re-purification and recycle systems but up to 5% of product can be lost by poor plant producers and off-quality material.	Enclosed in Al or stainless steel for 5 to 25 year period.
Mkt. Benignus/ Bryant Eng.-Kountz/ Mfg-Hodges: 5% of production could be 1M lbs/year. This is a big loss for the type of pollution we are trying now to guard against.	Will ultimately have to dispose of capacitor products. Recommend we try to save this product for a time.
Action	
Eng.,TSD-Plant Pollution Control Hodges/ Kountz: Monsanto must start to work with capacitor people to clean up plant practices. We have set-up to accept material for rework into hydraulic fluid but this relocation is not a satisfactory solution. Material must be reworked to electrical grade or destroyed, whichever is more economical. Must start now to get control of off-grade material.	Recommend replacement of future Aroclor business with other products. Have 2 years.
Action: Monsanto must help plant clean-up of customer plants decantation, coalescing, adsorption, disposal of adsorbent or recycle of adsorbents. Monsanto badly needs "know-how" for clean-up. Monsanto should seek Govt. contract money for clean-up research, (See MRC R. Binning, D. Nelson)	

DSW 014260

Transformers	Transformer Plant can operate in a clean, efficient manner with recycle of off-grade Aroclor.	Product transformer can remain closed s no exposure for 35
Action Benignus/ Bryant	Should advise disposal of filter element materials so as to minimize chance of water pollution. Incinerate or dispose.	
	Reworked transformers pose a threat if the Aroclor is dumped into a water stream.	Should try to retai business by clean-u by education of cus tomers.
Action Benignus/ Bryant	Should try to minimize chance of dumping "old" fluid by re-working and by educating co. shops and collecting product for rework or disposal.	
	Dalton is set up in England to rework electrical grade fluid.	
Kuhn/Kountz Findett?	Need rework facility here + disposal scheme.	

Monsanto Plants

The Dept. of Interior and/or State authorities could monitor plant outfall and find ppm of chlorinated biphenyls at Krummrich or Anniston anytime they choose to do so. This would shut us down depending on what plants or animals they choose to find harmed.

Action - Take steps to see that every precaution is taken to prevent Aroclor entering water streams. Try to reduce to ppb level.

In progress

P.Hodges-TSD - Seek a Govt. contract on adsorption and incineration cycles - MRC.

Engrg.-Kountz - Take samples of streams and river water and mud evidence for before and after clean-up. Samples can be stored for further analysis if we can't keep up current with analytical determinations.

Apply Monsanto clean-up methods to customer plant clean up equipment and procedures.

DSW 014261

Action - Engrg. & Mfg. Kountz and Kuhn

Evaluate liquid incinerators vs. solids handling incinerators for disposing of Aroclor and pentachlorophenol wastes. I estimate Aroclor disposal at 1-4M lbs/year, exclusive of cleaning up river bottoms or outfall bottoms.

Hydraulics	20% of 4M lbs	800,000 lbs
Heat Transfer	10% of 2M lbs	200,000 lbs
Capacitors	5% of 20M	1,000,000 lbs
Transformers	5% of 15M	750,000 lbs
		2,750,000 lbs

Central Eng. & Mfg TSD

Kountz & Kuhn

Possible help from MRC

Set up an incinerator to handle Aroclor disposal - preferably one which will handle solids such as muds - slurries as well as liquids. Have in operation within 12 months. Ideally have incinerators available different sections for disposal.

Chronic Toxicity Studies - Ind. Bio-Test

Wheeler Keller Ind.Bio-Test

Continue studies to establish FDA type limits of toxicity on Aroclor 1242, Aroclor 1254 and Aroclor 1260.

Rework with R. Keller-S. Tucker the number of samples which are to be analyzed for Aroclor in tissue. Try to see if Aroclors are changed metabolically. Does concentration level off, decline if feeding is stopped?

Institute studies against the most limiting biological parameters. If shrimp are the most limiting species for Aroclor levels of toxicity, then we will have to have biological studies on these species to confirm or deny adverse findings.

Action - Engrg. & Mfg. Kountz and Kuhn

CONFIDENTIAL

MINUTES OF AROCLOR "AD HOC" COMMITTEE

First Meeting

Date: September 5, 1969

Present: M. W. Farrar
P. B. Hodges, Secretary
E. V. John
W. R. Richard
E. P. Wheeler, Chairman

Objectives: (Agreed to by the Committee)

Submit recommendations for action which will:

1. Permit continued sales and profits of Aroclors and Terphenyls.

2. Permit continued development of uses and sales.

3. Protect image of Organic Division and of the Corporation.

Background Discussion of Problem:

1. Agreed that we should concentrate on Aroclor 1254 and 1260. Aroclor 1242 has not yet been incriminated for these possible reasons:

   a. Nature of uses of 1242 minimizes environmental contamination.

   b. It may degrade biologically.

   c. Unless analytical techniques are performed carefully, 1242 can be destroyed by oxidation during the analyses.

2. PCB has been found in:

   a. Fish, oysters, shrimp, birds.

   b. Along coastlines of industrialized areas such as Great Britain, Sweden, Rhine River, low countries, Lake Michigan, Pensacola Bay, in Western wild life (eagles). It may be a global contaminant.

3. PCB has been tied to DDT in effects on disappearance of wild birds which have fish diets. Ratio of PCB to DDT has been about 40-50:1 generally. Dr. Reisboro reported almost 1:1 ratio. PCB may be contributing to or exaggerating the effects of other chlorinated aromatics.

MONS 030483

4. Sample acceptance from the numerous researchers was discussed. This has been done on a limited basis. Our corroboration of testing of their samples adds to our knowledge and demonstrates a willingness by Monsanto to help define the problem, but it is expensive and also tightens any possible legal cases against us--it rules out possibilities that Aroclors are not involved.

5. Toxicity levels:

Aroclors have been shown to be safe for man in reasonable exposure concentrations. We are testing 100 ppm in diet of rats and dogs on a rule-of-thumb basis that 1/100 of toxicity level is safe and 1 ppm is probably the upper limit in total diet.

"Allowable levels" are probably lower than DDT. The worst example to date is the test at Pensacola where 5 ppb was found to be toxic to shrimp in 18 days exposure.

One problem we are facing is to keep the "safe level" (?) for shrimp from being applied to e.g. Lake Michigan where more tolerant fish species probably exist. We need to show the safe level in shrimp, clams, oysters and several species of fish.

Many toxicity studies on PCB are underway and it was agreed to be desirable to keep contact with all laboratories which have requested Aroclor samples. One-half to two-thirds of the sample requests have come from state labs (who would let us know what they are doing) and about 1/3 have come from universities (who may give us the "brush-off"). Question of who should call on the laboratories was not resolved.

6. Escambia River Problem:

For a clearer understanding of the general problem, the situation at Pensacola was reviewed. From a relatively negligible discharge of 1-3 gal/day into a large river, 1/4 mile downstream levels of 42 ppb in water and 476 ppm in mud were found. Although use of Aroclor was halted immediately, we can expect the water contamination to continue for a lengthy period by leaching from the contaminated mud. No downstream samples have yet been taken to measure the decrease in contamination (as of 9/5/69).

7. Problem in Producing Plants:

P. Hodges reviewed what was being done to stop gross losses at Anniston and at WGK. Basically, the work to date consists of stopping or trapping any sewering of free Aroclor with return to process or land fill disposal of the trapped Aroclor. This will reduce levels in plant effluents to below solubility ranges, particularly as we move to install traps (or sumps) back into the waste source points where flows are small and as yet undiluted by Aroclor-free waste streams. The question of exactly how far to reduce (how much money to spend) is not yet clear and expenditures to date have been comparatively small. It was agreed that, until the problems of gross environmental contamination by our customers have been alleviated, there is little object in going to expensive extremes in limiting discharges from the plants.

One problem that has been interfering with logical development of our plant Aroclor waste reduction programs has been delays in obtaining analytical results from in-plant and ex-plant sampling. It was agreed that additional help was necessary in Dr. Tucker's lab but no specific actions were proposed. In addition to in-plant work, the plants are sampling the receiving streams.

Air pollution reduction has not been considered by the plants to date except as incidental prevention of product contamination during tank car and drum loading operations. Long range (1-2 year) improvements at Anniston are planned to reduce product contamination (and air emissions) in car loading operations. It was agreed that a comprehensive air sampling and testing program would be very expensive and is probably not justified at this stage of the problem.

8. Environmental Contamination by Customers:

Our in-plant problems are very small vs. problems of dealing with environmental contamination by customers. In one application alone (highway paints), one million lbs/year are used. Through abrasion and leaching we can assume that nearly all of this Aroclor winds up in the environment.

Because the rate of natural (bio-degradation) is very low, other degradation must destroy PCB equal to the rate of environmental exposure in order to avoid build-up of contamination.

A general discussion was held on philosophy of controlling sales or working with customers to prevent pollution by PCB.

MONS 030485

Action Planned:

Each member of the group will submit to the other members for consideration possible ideas and programs to help accomplish the overall objectives set by the Committee. Following review of the suggestions, the Committee will meet again at an early date to be arranged by the Chairman.

P. B. Hodges
Secretary

From: M. N. Farrar
P. B. Hodges, Secretary
E. V. John
W. R. Richard
E. P. Wheeler, Chairman

DSW 014612

CONTENTS

Summary of the problem

DSW 014613

On August 25,

OBJECTIVES

At a meeting of business group directors of Function Fluids and Plasticizers with Organic Division and Corporate Staff members, an "ad hoc" committee was appointed to prepare a resume of the situation concerning the environmental contamination through the manufacture and use of polychlorinated biphenyls (Aroclors).

The objective of the committee was to ~~prepare~~ recommended action that will:

1. Protect continued sales and profits of Aroclors;

2. Permit continued development of new uses and sales, and

3. Protect the image of the Organic Division and the Corporation as members of the business community recognizing their responsibilities to prevent and/or control contamination of the global ecosystem.

PROBABILITY OF SUCCESS

The committee believes there is little probability ~~(illegible)~~ that any action that can be taken will prevent the growing incrimination of specific polychlorinated biphenyls (the higher chlorinated--e.g. Aroclors 1254 and 1260) as nearly global environmental contaminants leading to contamination of human food (particularly fish), the killing of some marine species (shrimp), and the possible extinction of several species of fish eating birds.

Secondly, the committee believes that there is no ~~possible~~ practical course of action that can so effectively police the uses of these products as to prevent environmental contamination.

There are, however, a number of ~~possible~~ actions which must be undertaken in order to prolong the manufacture, sale and use of these particular Aroclors as well as to protect the continued use of other members of the Aroclor series.

The ultimate that can be expected is the continued use (less than 5 Chlorines) of the lower chlorinated biphenyls and the chlorinated terphenyls in applications amenable to such control that there is practically zero losses to the environment. In the interim we would hope to establish by appropriate research efforts "tolerance" or safe levels for particular Aroclors in the environment.

- The identification is ~~poss~~ positive
- Toxicity towards certain species is high.
- Persistance is high.
- Likely hood of natural origin or degradation is remote.

DSW 014615

RECOMMENDATIONS

OK 1. In view of legal and moral considerations, notify all Aroclor 1254 and 1260 customers of environmental contamination problem. + advising customers.

3, 2. Consult with appropriate federal agencies' headquarters in Washington to determine current status of concern and to inform appropriate individuals therein of Monsanto's research and control efforts.

4, 3. Personally contact all governmental and university laboratories which have requested Aroclor samples and indicated interest in the environmental contamination problem.

2, 4. Reduce losses of Aroclors in liquid wastes from Monsanto plants to ~~absolute~~ minimum. Goal ~~0~~ to 25 ppb for 1254 & 1260. ~~10 parts per billion~~.

5. Determine extent of atmospheric losses from Aroclors from Anniston and WGK Plants and develop plans for control.

6. Analyze in Organic Division laboratories (or by contract) selected appropriate samples from:

   a. Environment of Anniston and WGK Plants.

   b. Monsanto products where contamination is possible.

   c. Agencies and/or laboratories attempting to pinpoint specific sources of contamination.

   d. Customer plants' environments.

   e. Research efforts involved in biological studies--i.e. animal, bird and fish toxicity studies and biodegradation studies.

7. Expand analytical capabilities in conjunction with items 5. and 6. above.

RECOMMENDATIONS (Continued)

8. Assign one individual from the division full-time for three to six months to coordinate division and Corporate Staff department efforts.

9. Establish special budgetary account to allow implementation of these recommendations and the continuation of the toxicological research effort now underway and continuing until June, 1971.

DSW 014617

BASIS FOR RECOMMENDATIONS

1. Notification of All Customers

Feb.

On ~~September~~ 24, 1969 the San Francisco Chronicle published a "scare" story following an interview with Dr. Robert Risebrough of the University of California. The latter had recently published in Nature the finding of polychlorinated biphenyls in fish, birds and eggs in the California coastal areas.

On March 3, 1969, the Functional Fluids group sent a letter to the 31 major Aroclor customers in the transformer and capacitor applications. The letter included a copy of the Chronicle story and a Monsanto statement concerning the situation. This was intended to announce to these customers that the polychlorinated biphenyls might be in trouble and implied that the customers should make every effort to prevent loss of these materials to the environment. There has been subsequently some follow-up with at least General Electric and Westinghouse.

It has been recognized from the beginning that other functional fluid uses could lead to losses of the Aroclors to liquid waste streams from the customers' plants. Losses could occur from spills, unusual leakage of large volumes and daily losses of smaller volumes.

It has also been recognized that there could be vapor losses but it has been felt that these were perhaps of less significance than the vapor losses in plasticizer applications. The concern for vapor losses rises from the published proposed theory that even minute quantities of vapors are eventually transferred to the water environment and accumulated therein.

Another possible source of air environmental contamination is the eventual destruction of materials which have Aroclors in them. Of particular significance might be the burning or partial incineration of waste or used products containing the Aroclors.

BASIS FOR RECOMMENDATIONS (Continued)

As the alarm concerning the contamination of the environment grows it is almost certain that a number of our customers or their products will be incriminated. The company could be considered derelict, morally if not legally, if it fails to notify all customers of the potential implication.

A case in point is the recent determination (mid-~~August~~ sept.) that milk to be marketed by the Maryland Cooperative Milk Producers, Inc. in Baltimore was contaminated with polychlorinated biphenyls. The source of the PCB's was isolated to six dairy herds in Martinsburg, West Virginia. Investigation by the Producers Association is continuing but to our knowledge the specific source of the PCB has not been pin-pointed.

When the Aroclors were indited as causing poisoning in cattle in the mid-1950's, chlorinated naphthalenes were eventually identified as the causative agent. The naphthalenes were used in greases or lubricants for cattle feed machinery and had contaminated the animal food. (Members of the Medical Department have been told that the Texas company "bought" 6,000 head of cattle around the country as a result of this incident. It is not known whether or not the suppliers of the naphthalenes to Texaco were brought into the settlement.) Are our customers selling grease or lubricants containing Aroclors that are now responsible for the milk contamination?

In the plasticizer use area, the Aroclors may be used in rubber based paints or surface coatings. The uses for these surface coatings include the interior walls of potable water supply storage tanks in some communities. In Europe we have been told that similar paints are widely used for swimming pools. In spite of the low degree of solubility of the PCB's in water, there are sentiments among the European scientists (and our PCB competitive manufacturers) that such uses may be sources of pollution.

Other customer applications or uses which could be suspect include highway marking paints, ~~and~~ any of the oil and/or grease lubricant applications, caulking compounds - sealants,

DSW 014619

BASIS FOR RECOMMENDATIONS (Continued)

2. Consultation with Federal Agencies

In August of 1968 when the current effort related to this problem got underway, the scientists at the U. S. Department of Interior, Fish and Wildlife Laboratories at Paturent, Maryland were visited. In the six to twelve months that the laboratory had been looking for PCB residues, they had identified such compounds in dead eagles as well as marine birds. At that time they did not report positive findings in fish, shell fish or other marine organisms. We know that their efforts have been continuing at an accelerated rate but the laboratory has not been revisited to learn of current developments.

The U. S. Food and Drug Administration in Washington called Dr. Kelly in June to report that the State of Georgia had found PCB's in milk (we had in April supplied samples of our Aroclors to the Georgia State Department of Agriculture Laboratories in Atlanta).

The analyses of milk from the Maryland co-op mentioned in 1. above were performed by an FDA laboratory.

On Friday, September 26, we were asked to send samples to the Atlanta Toxicological Branch of the FDA and to the Residue Chemical Branch Division of Pesticides, FDA in Washington. The stated reason for the request was for these laboratories to determine the "acute toxicity" of Aroclors 1254 and 1260.

In the past year we have had request for samples from five or six of the regional laboratories of the Federal Water Pollution Control Administration--an agency within the U. S. Department of Interior. We have not had an opportunity to follow-up with these laboratories as to their interest or concern.

In August a laboratory of the Bureau of Commercial Fisheries, Department of Interior, at Pensacola, Florida, reported finding PCB's in the river below our Pensacola Plant. Subsequently, they reported that 5 parts per billion of Aroclor 1254 killed baby shrimp in 18 days. There has been no follow-up by St. Louis based personnel since our Pensacola Plant discontinued the use of Pydraul AC.

BASIS FOR RECOMMENDATIONS (Continued)

Appropriate individuals in the parent federal agencies should be visited to determine their current activities and concern and, secondly to make these agencies aware of Monsanto's interest, research and control efforts.

3. Contact with other Governmental and University Laboratories

In addition to the above, Monsanto has provided samples of the Aroclors to 30 or 40 other governmental and university laboratories or scientists. It would be prudent and appropriate for someone from Monsanto to personally follow-up the supplying of the samples and determine the status of the efforts of these groups. For example, the State Department of Agriculture Laboratory in Hartford, Connecticut reported in July that they had found PCB in fish off the coast of Connecticut. This led to two articles in the Hartford Times and a five minute radio program through a syndicated outlet of 108 radio stations.

4. Losses from Monsanto Plants

Efforts to reduce the losses of Aroclors in liquid wastes from the Anniston and WGK Plants are completed or underway. It is impossible to establish a limit as to what can be discharged "safely". Investigation has shown that the waters in receiving streams below the Anniston Plant contain significant (parts per million) concentrations of PCB. More ominous perhaps is the fact that sediment in the bottom of these streams miles below our plants may contain up to 2% Aroclor.

To prepare for the eventual publication in the press of the discharge of PCB's in Alabama and to the Mississippi River, a significant effort must be made to determine the present levels of contamination and more importantly, determine the levels of contamination as "clean up" procedures begin to show an effect.

The incident at the Monsanto Plant at Pensacola indicates that all Monsanto Plants using Aroclors should be made aware of the potential problem and efforts made to eliminate any losses. The significance of "any losses" may be related to the one to three gallons per day which was being lost at the Pensacola Plant.

BASIS FOR RECOMMENDATIONS (Continued)

Hopefully research efforts will indicate that a "safe level" of losses would be higher in fresh water streams not adjacent to coastal estuaries. At the present time we know of no claims that the PCB's are "destroying" fish.

5. Atmospheric Losses at Anniston and WGK

The determination of atmospheric losses for our Aroclor manufacturing plants will be more tedious and time consuming than in the case of liquid wastes. We will never be prepared to discuss intelligently potential problems of our customers where there may be atmospheric losses until we have some data on our own plants. This is particularly true if we ever expect to recommend to our customers measures for control of atmospheric losses.

6. Analytical Capabilities (a. through e. inclusive)

In each of the recommendations 2. through 5. above, there is the implication that Monsanto's best interest could be served by appropriate sampling and analysis. In connection with any of the governmental and other laboratories, we must accept their reported analytical results or in specific instances offer to run duplicate analyses to confirm for ourselves the validity of the reported results.

The committee agrees that to perform analyses that would confirm all of the reported findings represents an unreasonable cost in terms of personnel and facilities. At the same time there appears to be no alternative to the acceptance in the last three months that confirmation analysis in selected cases should be done. This has led to an accumulation of a backlog of samples which need attention. Delays in analysis are occurring because of shifting priorities for samples as they are received or as they have been retained.

A case in point is the delay in analyzing thirteen samples from the Inorganic Division. Samples were submitted following the finding that five of five commercially available electric dishwashing compounds analyzed showed the presence of PCB's. The Inorganic Division can not exonerate the products it sells to the detergent manufacturers until it has some data showing whether or not Monsanto supplied materials are contaminated. In the meantime Inorganic Division Quality Control has

BASIS FOR RECOMMENDATIONS (Continued)

suggested to its Division Engineering that future designs for making detergent components insure that the use of Aroclors will not permit contamination. Secondly, it is obvious that the Division cannot approach its detergent manufacturing customers about their potential problem until the above data indicate that "our own skirts are clean".

This week it was agreed that milk and water samples from the Maryland co-op in Baltimore should take precedence over other samples which had been scheduled.

In summary, the committee believes there will be a growing number of samples from the following:

a. Environment of Anniston and WGK Plants.
b. Monsanto products where contamination is possible.
c. Agencies and/or laboratories attempting to pin-point specific sources of contamination.
d. Customer plants' environment.
e. Research efforts involved in biological studies--i.e. animal, bird and fish toxicity studies and biodegradation studies.

7. Expansion of Analytical Capabilities

The recommendation to expand the analytical capabilities is a necessity in view of the preceding recommendations.

8. Assignment of Full-Time Effort

Up to this time the coordination of the Division effort has been principally the responsibility of W. R. Richard and E. P. Wheeler with support from R. E. Keller and Cumming Paton. Each of these individuals has other responsibilities to the extent that, although the Aroclor problem may have been a predominant issue, other areas of interest could not be slighted.

The committee believes that the problem is of sufficient seriousness to warrant the full concentration of at least one individual for the next three to six months. Those who have been involved up to this point would obviously continue in their

BASIS FOR RECOMMENDATION (Continued)

supporting efforts where the individual's background or expertise would make it appropriate. For example in connection with the follow-up with the federal agencies in Washington, Dr. Kelly would expect to be present for any contact with USFDA officials.

Other members of the Medical Department would be made available for contacts with the pollution control agencies or those laboratories or universities where toxicity appears to be of interest or concern.

Certainly Dr. Keller and Scott Tucker should accompany anyone making visits where the specific question of analytical techniques was to be discussed.

This still leaves a number of man months to be devoted to the other laboratories or agencies which have up to this point not made their specific interest known.

Equally if not more important is the effort which must be made relating to the contacts with customers. The committee does not believe that this can be handled by district marketing representatives without supplying such "local" individuals with a complete background of the problem.

9. Budgetary Considerations

The committee recognizes the restrictions placed on those currently involved by mandates to operate within normal or proposed reduced budgets. It should be clear, however, that the product groups, the Division and the Corporation are faced with an extraordinary situation. There can not be too much emphasis given to the threat of curtailment or outright discontinuance of the manufacture and sales of this very profitable series of compounds. If the products, the Division and the Corporation are to be adequately protected, adequate funding is necessary.

EXHIBIT 11

July 23, 1969

Mr. A. Bruce Pyle
Assistant Bureau Chief
Department of Conservation
and Economic Development
P. O. Box 1809
Trenton, New Jersey

Dear Mr. Pyle:

In connection with your recent request for more specific information on PCB, I have enclosed several items that may be of interest.

The first is a table showing the physical characteristics and properties of our Aroclors, the trade name for our polychlorinated biphenyls.

The numerical designation of these materials is meaningful. The 1200 series are biphenyls chlorinated to the extent indicated by the last two numerals. For example, Aroclor 1242 is biphenyl chlorinated to the extent of 42%; Aroclor 1254 is biphenyl chlorinated to 54%.

The 5400 series are terphenyls chlorinated to the extent of the last two numerals. Thus Aroclor 5460 is terphenyl chlorinated to 60%. The 2500 and 4400 materials are mixtures of biphenyls and terphenyls chlorinated to 65%.;

We have typed on the bottom of the table the results of acute toxicity studies. These indicate the approximate lethal dose in rats when administered orally and the minimum lethal dose when the samples were applied to the unbroken skin of rabbits. You will note that the samples were administered undiluted or as various concentrations in corn oil depending on the physical form and solubility of the sample.

00062

The second enclosure refers to the only published data that we now have concerning possible toxicity to fish. This enclosure is a 1957 report from the U. S. Fish and Wildlife Service showing the results of studies to determine the possible effects of chemicals to larval lampreys and fishes. The enclosure includes a copy of the title page, the page explaining the table and that portion of the table which indicates that four of the Aroclors have no effect on trout, bluegill and larval lampreys at a concentration of 5 ppm in a 24 hour test period.

The only chronic toxicity data that we have refers to the inhalation of vapors of Aroclor 1242 and 1254. Enclosure three is a reprint describing the chronic inhalation studies and enclosure four is a Hygiene Guide published by the American Industrial Hygiene Association which prescribes safe handling techniques for the use of these materials in industry.

Based on available data, manufacturing and use experience, we do not believe the polychlorinated biphenyls to be seriously toxic. At the same time we have also recommended precautions to avoid repeated and prolonged skin contact and secondary avoidance of inhalation of vapors when the materials are heated. As indicated by the distillation ranges in enclosure one, these products have extremely low vapor pressure and thus present little vapor inhalation hazard at ambient temperatures.

I don't know that I can add a great deal to your question to the use of these materials without repeating the comments in the statement which Tom Ford sent you. Their dielectric characteristics lead to usage as insulating fluids for transformers and capacitors. Transformer application is in sizes applicable to sub-stations rather than the small transformer on lines for reducing voltage for household use.

The plasticizer type application PCB's are incorporated into a polymer as an integral part of the solid material. This is the case whether the polymer is then used as an adhesive special elastomer or individual surface coating.

Contrary to some reports from the press, the PCB's are not used in rubber tires, lipstick, or the common plastic containers or films used for industrial or household packaging.

00063

We have a considerable research effort underway to determine the toxicity of several of the PCB's in rats and dogs. We are also including three generation reproduction studies in rats. Also underway are studies with fowl to determine the possible chronic effect on the birds themselves, egg size and production, hatchability of the eggs and viability of the chicks. We will also do studies to determine any possible effect on egg shell thickness and calcium and phosphorus metabolism.

We have attempted to establish a program for determination of the possible biodegradation of the polychlorinated biphenyls but research of this type is not yet underway.

Re-emphasizing a point we attempted to make in the statement Tom sent you, we are unable at this time to conceive of how the PCB's can become wide spread in the environment. It is certain that no applications to our knowledge have been made where the PCB's would be broadcast in the same fashion as the chlorinated hydrocarbon pesticides have been. I am sure there will be much more research undertaken to clarify some of the questions that early research efforts have raised and you may be sure that we will participate in a number of these.

If I can be of any further assistance after you have reviewed this letter and the enclosures, please let me know.

Sincerely,

Elmer P. Wheeler
Manager, Environmental Health

March 27, 1969

Mr. Fred H. Dierker
Executive Officer
State of California-Resources Agency
San Francisco Bay Region
Regional Water Quality Control Board
364 Fourteenth Street
Oakland, California 94612

Ref: File No. 2119-1075

Dear Mr. Dierker:

This letter is written in response to your letter dated March 7, asking several questions concerning polychlorinated biphenyls ("PCB") manufactured by Monsanto. Responses to each of your questions are set forth below, numbered in accordance with your letter.

1. We have recently contracted with a consulting laboratory to undertake fish toxicity studies on PCB's. Because of the low solubility of PCB in water, it may be difficult to obtain a 96-hour TL_m. Depending upon the results of the initial studies, we may conduct 30-day exposure experiments.

2. Attachment A shows the general physical characteristics of PCB. Information set forth on the bottom of these pages shows the results of acute animal toxicity studies showing the oral LD_{50} in rats and the minimum lethal skin dose when applied to rabbits. You will note that these results were obtained using undiluted samples or as a corn oil suspension solution depending on the viscosity and solubility of the materials.

NEV 031051

780589
00066

3. & 5. Attachment B shows the results of studies of chronic inhalation. You will note in the table describing the properties of various PCB's that the liquid materials have extremely high distillation ranges and that waxy or resinous materials have to be distilled under high vacuum. These data attest to the low vapor pressure of the materials at ambient temperatures.

PCB finds primary use in applications requiring chemical stability, good dielectric properties, fire resistance, low volatility and water insolubility. When used in dielectric fluid, PCB is hermetically sealed in capacitors and transformers, designed for 20 to 30 years life at temperatures at or near ambient temperatures.

Plasticizer PCB is found primarily as a plasticizer for surface coatings such as corrosion resistant paints, industrial adhesives and as a sealant such as window sealants. These applications do not include automobile tires, or floor tile. These applications of PCB emphasize its inertness and low volatility to provide long service life for the product without loss of flexibility. In normal use, PCB plasticizer applications are ambient temperature environments presenting no special health problems. In view of PCB's chemical inertness, we would anticipate no problems associated with the environment from refuse dumps.

PCB finds further application in industrial (excluding aviation) hydraulic and heat transfer systems. As in the case of dielectric applications, these systems are designed for essentially indefinite fluid life.

4. PCB is essentially insoluble in water, which is a property valued for most of its industrial applications. The solubility of PCB varies with the number of chlorine atoms. Solubility in tap water at 25°C. is as follows:

Material	Solubility in Water
PCB - (42% chlorine by weight)	203 ± 10 ppm
PCB - (48% " " "	106 ± 14 ppm
PCB - (54% " " "	50 ± 2 ppm

This data indicates that the most highly chlorinated PCB's are the least soluble in water. Annual consumption in the Bay Area is less than 500,000 pounds for all PCB applications.

6. It is a long standing policy at Monsanto not to disclose information concerning our customers, including the customer's name. However, we desire to cooperate with you to the fullest extent practicable in this matter. Should you desire to visit typical PCB users we will be happy to approach our customers to arrange a visit.

7. We advise persons using PCB products to take normal precautions associated with handling most synthetic materials. If accidentally spilled on hands, no serious skin irritation should occur. However, PCB has a solvent action (similar to paint thinner) on the fats and oils of the skin and prolonged contact may lead to drying and chapping of the skin.

   In the event of contact, the skin should be washed with soap and water. Saturated clothing should be removed and dry cleaned. Spills may be cleaned up with rags, sawdust or absorbent clay. Eye contact may result in painful irritation but should cause no permanent damage to tissues. In the event of eye contact, the eye should be flushed with large amounts of water. As with all eye first-aid, a physician should be consulted. To relieve irritation, physicians have used a 1% Pontocaine as well as ophthalmic cortisone acetate solution, or castor oil.

   Infrequent exposure to PCB vapor should not cause ill effects. However, prolonged exposure to high vapor concentrations should be avoided.

After many years of experience with PCB, it is our understanding that cases of harmful effects resulting from the industrial use of PCB have been extremely rare. We believe this is due largely to low volatility which reduces possible inhalation at ambient temperatures.

We sincerely trust that this answers the questions contained in your letter. As further information becomes available in which we feel you might be interested, we will pass such information on to you.

Yours very truly,

for Howard S. Bergen
Director, Functional Fluids

W. R. Richard

P. S. to H. S. Bergen only: Howard - Some ideas for your consideration may be appropriate based on my discussions with Phocion Park, J. Garrett and Bill Richard while preparing this response.

1. Phocion emphasizes that nothing should be volunteered on these type requests unless specifically requested, because of mis-interpretations and needless chances for confusion. We can always add but never subtract from something written.

2. We may want to consider, when appropriate, a personal visit in lieu of written communications. Personnel from Monsanto at such visits should not be our

technical experts but a responsible management representative who can relate critical questions. This permits time for preparing answers that will not allow mis-interpretation.

3. Anticipating negative impact of the Time Magazine article and continued negative comments by Riseborough at UC, a personal visit by such a person may help clear the air and solidify our image of cooperation before publicity expands via partially informed sources.

4. Estimated Bay Area Aroclor usage of 500M lbs. derived from following:

Plasticizers (per C. Paton)	48M lbs.
*Dielectrics	300M
Heat Transfer	100M
Hydraulic	50M
Total	498M lbs.

*Denotes usage for initial fill of new transformers. Actual consumption in Bay Area would be significantly less, perhaps 50-90% less.

I hope the above may be of value to you.

D. M. Pogue

Status of Aroclor Toxicological Studies

D. S. Cameron
Brussels

Enclosed is a copy of the reports from our consulting laboratory indicating the status of the animal toxicity studies. I have summarized the pertinent findings separately and as indicated in the table.

We have given copies of these data to one U. S. customer, the U. S. FDA and one or two other state agencies. I don't see why this information cannot be released with discretion in Britain or Europe.

Our interpretation is that the PCB's are exhibiting a greater degree of toxicity in this chronic study than we had anticipated. Secondly, although there are variations depending on species of animals, the PCB's are about the same as DDT in mammals.

We have additional interim data which will perhaps be more discouraging. We are repeating some of the experiments to confirm or deny the earlier findings and are not distributing the early results at this time.

The Aroclor* compounds are among the most unique, most versatile chemically-made materials in industry. Aroclors are so useful in so many ways in so many different applications, primarily because of one outstanding characteristic: *inertness.*

The Aroclors do not burn . . . and they impart fire-retardance to compositions in which they are mixed. The Aroclors do not "break down" under mechanical stress; therefore, they make good lubricants, sealants, and expansion media. The Aroclors are not decomposed by, nor do they conduct even tiny amounts of, electricity; therefore, they are outstanding dielectrics. Heat has little effect on the compounds, hence the Aroclors are excellent heat transfer fluids. Since they are compatible with a wide range of synthetic resins, Aroclors make excellent plasticizers. Because Aroclors in formulations "trap" and hold more volatile ingredients, they make volatile insecticides and repellents "last longer" in residual activity.

And, important too, Aroclors are low in cost. Examination of their properties will show literally scores of uses in which no other material can serve.

The following pages describe the physical properties of the Aroclors and some of their many applications. These remarkable materials are manufactured exclusively by Monsanto.

*Aroclor is a trademark of Monsanto Chemical Company for its chlorinated aromatic hydrocarbons and their derivatives, including chlorinated diphenyl. Reg. U. S. Pat. Ofc. In this brochure, Aroclor is frequently used as a plural noun solely to improve the ease of reading and as a convenience to the reader. In every instance of such use, however, the usage refers to Monsanto Aroclor brand of polyphenyl compounds.

refer to technical bulletins

0509822

0509823

THE aroclors...

Aroclor compounds are a series of chlorinated biphenyls and chlorinated polyphenyls. They range in form and appearance from mobile oily liquids to fine white crystals and hard transparent resins. Aroclors are non-oxidizing, permanently thermoplastic, of low volatility, and non-corrosive to metals. Aroclors are not hydrolyzed by water, alkalis, or acids. The viscous liquids and resins will not support combustion when heated alone, and they impart fire retardance to other materials.

The crystalline Aroclors are relatively insoluble, but the liquid and resinous compounds are soluble in most of the common organic solvents, thinners and oils. All Aroclors are insoluble in water, glycerine or the glycols. Aroclor 5460 is insoluble in the lower molecular weight alcohols; "4465" is only partly soluble in the lower alcohols.

The following table describes the properties of twelve Aroclors, each of which is representative of a series. For almost every Aroclor shown, there is a dark-colored grade of approximately the same physical and chemical characteristics. These darker products are less pure but are lower in price.

Aroclors are used alone for particular physical jobs, such as insulating, heat transfer, sealants and expansion media; and they are used as components or extenders in elastomers, adhesives, paints, lacquers, varnishes, pigments and waxes. The properties imparted by Aroclors (and their usefulness in particular applications) vary in regular gradient over the series. Selection of the right Aroclor for a particular use can generally be made by comparision of the properties, by "blending" two or more, and by adjusting the percentage used in the particular mixture in which the Aroclors will be formulated.

PROPERTIES THAT "MAKE JOBS" FOR THE aroclors

"NON-DRYING"

Aroclors are non-drying. Even when exposed to air in the form of thin films, no noticeable oxidation or hardening takes place. However, when used as components of paints, varnishes or lacquers, they do not retard the rate of drying of the films. Quick drying varnishes and paints can be made using Aroclors in the formulation.

"NON-FLAMMABILITY"

The viscous, oil-like Aroclors and the resins do not support combustion when heated alone, even at their boiling points — temperatures in excess of 350°C. Most of the Aroclors flux readily with other resinous and pitch-like materials to make mixtures that gain in fire retardance properties. Even when incorporated in nitro-cellulose films and rubber foams, Aroclors will retard the rate of burning.

"ADHESIVENESS" AND "THERMOPLASTICITY"

The Aroclor resins adhere strongly to smooth surfaces such as glass, metal, varnished or lacquered coatings.

The Aroclors are permanently thermoplastic. They apparently undergo no condensation or hardening upon repeated melting and cooling. Clear Aroclor resins can be supplied with softening points up to 105°C. Opaque, crystalline Aroclors can be supplied with initial melting points up to approximately 290°F.

0509827

STABILITY

Toward Alkalies — The Aroclors are remarkably resistant to the action of either hydrolyzing agents or high temperature. They are not affected by boiling with sodium hydroxide solution.

Toward Acids — Experiments were made to determine whether hydrogen chloride is evolved during the treatment of Aroclors with sulfuric acid. Aroclor 1254 (selected as typical) was stirred with an equal volume of ten per cent sulfuric acid for a period of 150 hours. Any gases escaping from the reaction flask had to pass through a trap filled with silver nitrate solution, which solution would give a precipitate of silver chloride if any HCl came in contact with it. After 150 hours of treatment, neither the trap solution nor the acid layer in the treating flask showed any hydrogen chloride present.

Even prolonged treatment (255 hours) with concentrated sulfuric acid indicated negligible effect.

Toward Heat — Because of their stability to heat, the Aroclors are useful heat transfer media. Aroclor 1254 and particularly the less viscous Aroclor 1248 are recommended for this purpose because they may be heated at temperatures up to 315°C (600°F) in a closed system for long periods without appreciable decomposition and they are, at the same time, fire resistant.

Toward Oxidation — When Aroclors are subject to a bomb test at 140°C with 250 pounds oxygen per square inch, there is no evidence of oxidation as judged by development of acidity or formation of sludge.

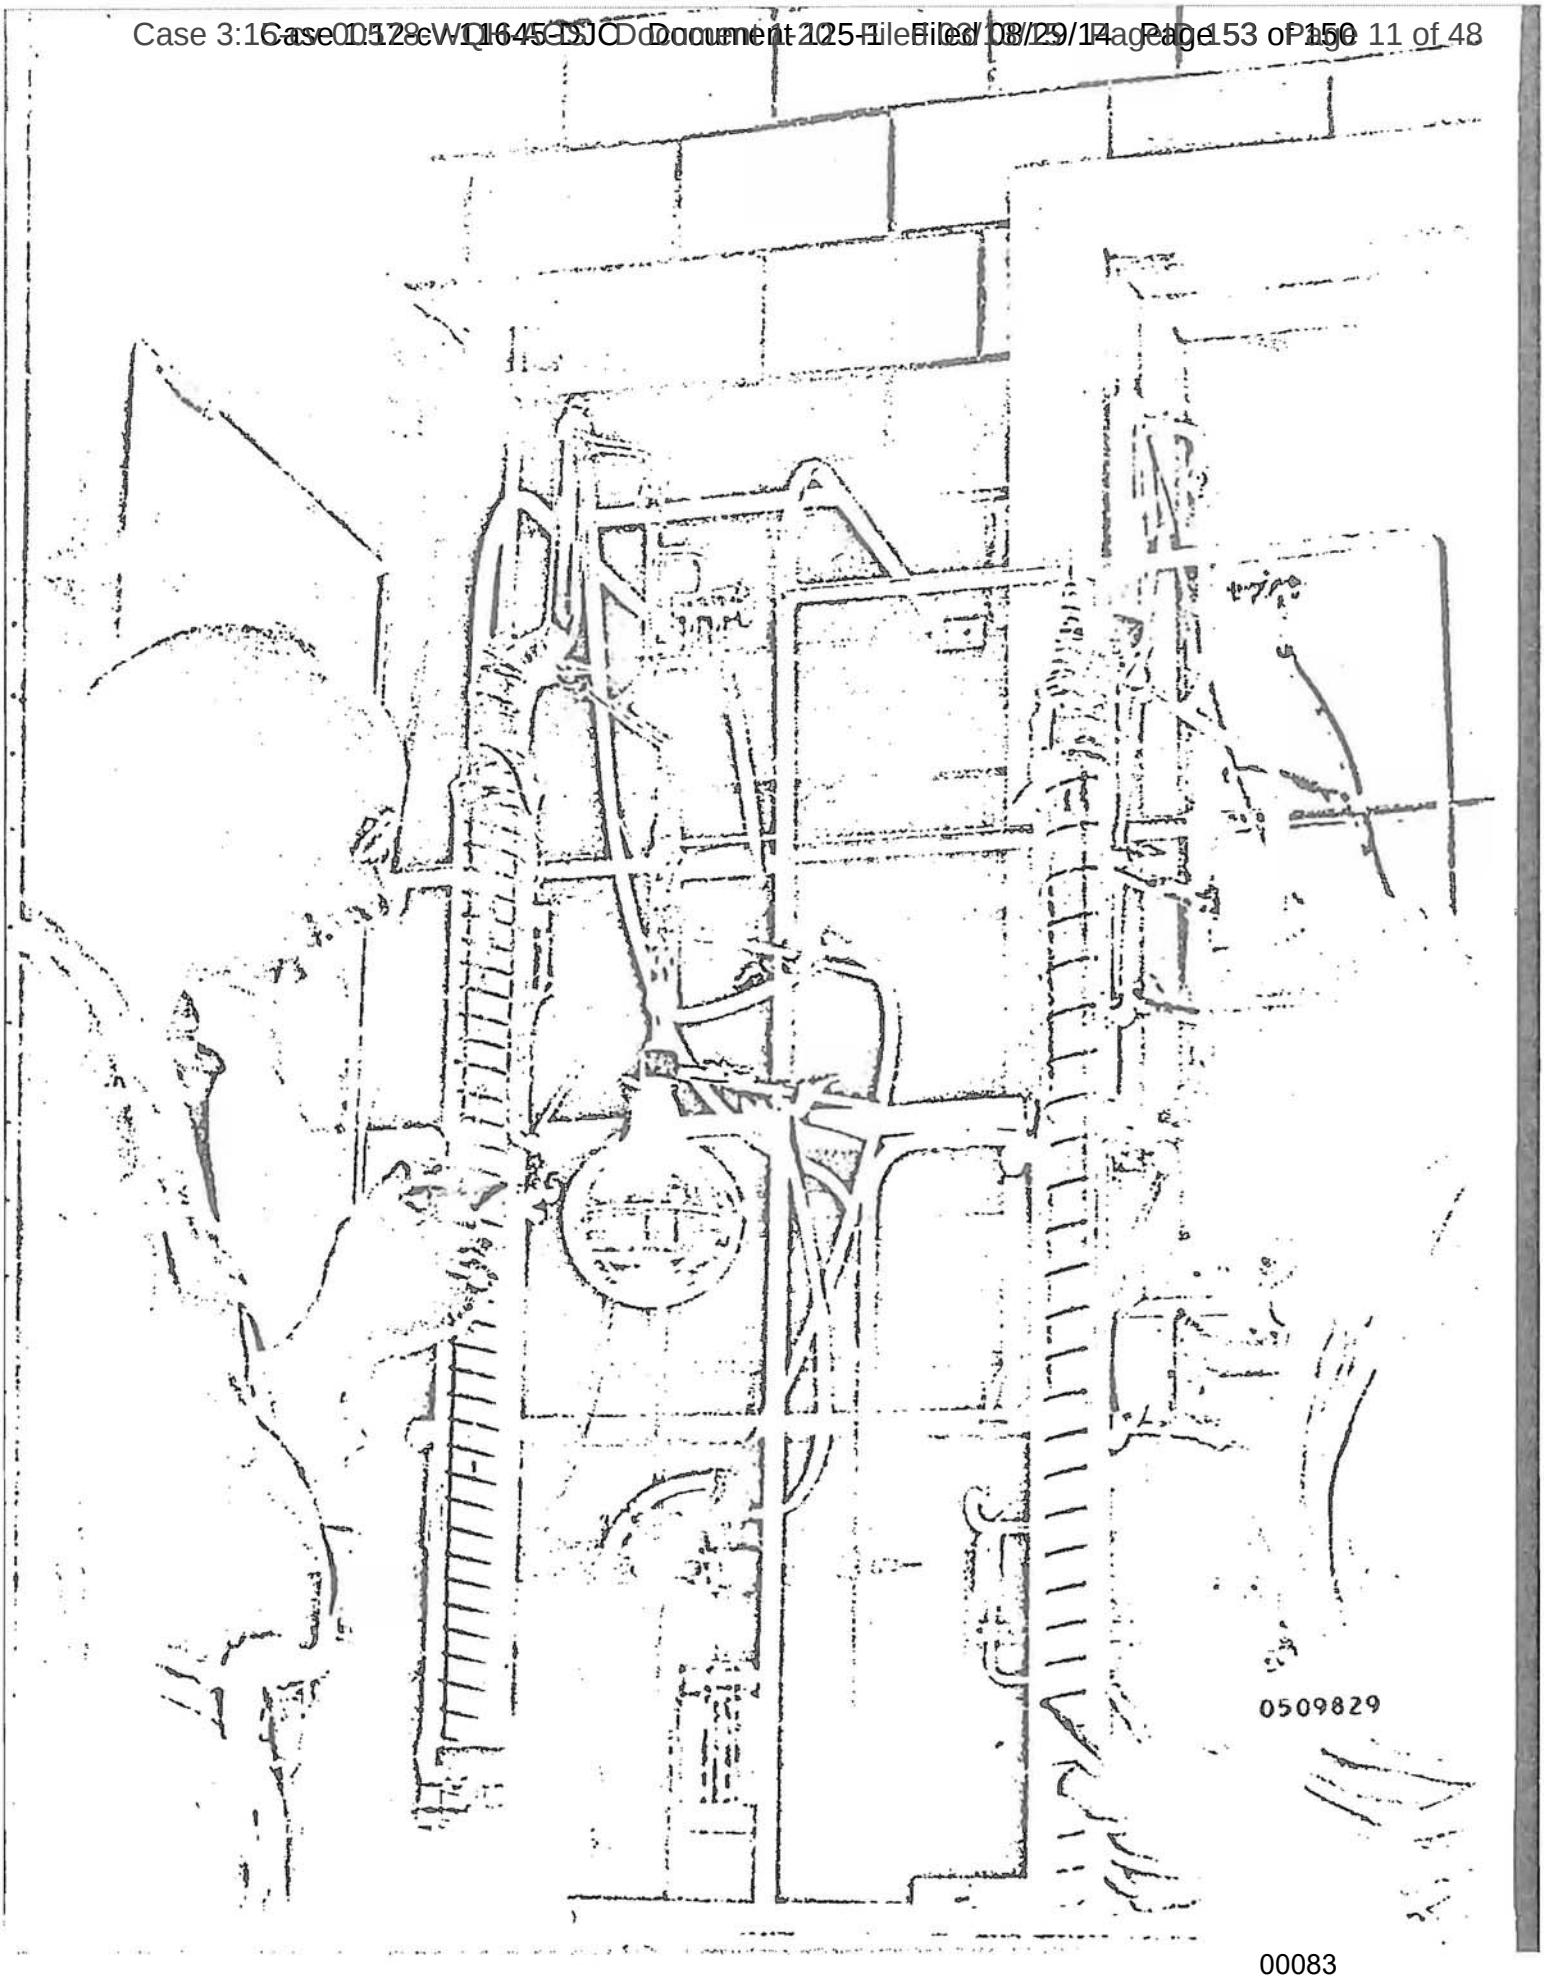
ELECTRICAL RESISTIVITY

The Aroclors have extremely interesting electrical characteristics: high resistivity and dielectric strength and low power factor. The dielectric constant ranges from 3.4 to 5.0 at 100°C and 1000 cycles, depending upon the particular Aroclor.

SOLUBILITY

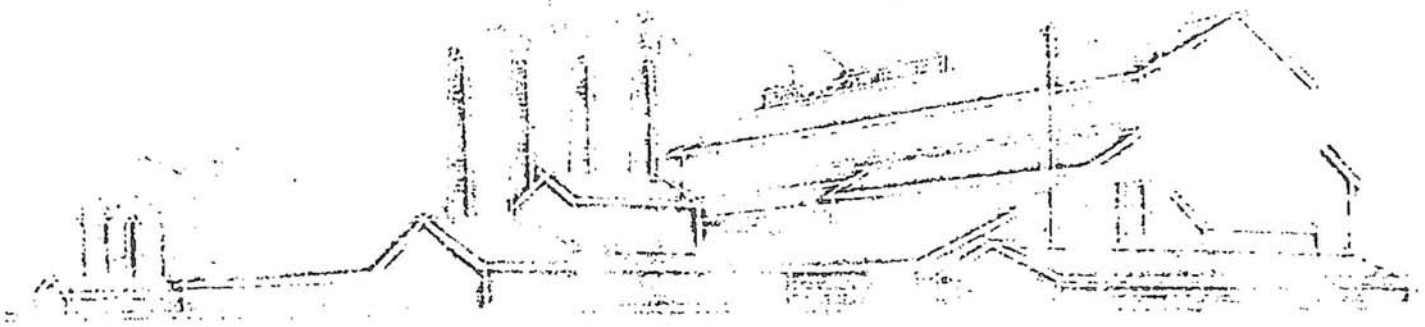
All Aroclors are insoluble in water. They are soluble, however, in most of the common solvents, plasticizers, and resins.

The Aroclor oils and resins are readily soluble in most of the common organic solvents and drying oils. The hard crystalline Aroclors are in general less soluble than the liquids or softer Aroclor resins. All the Aroclors are heavier than water, a valuable property for many applications.



0509829

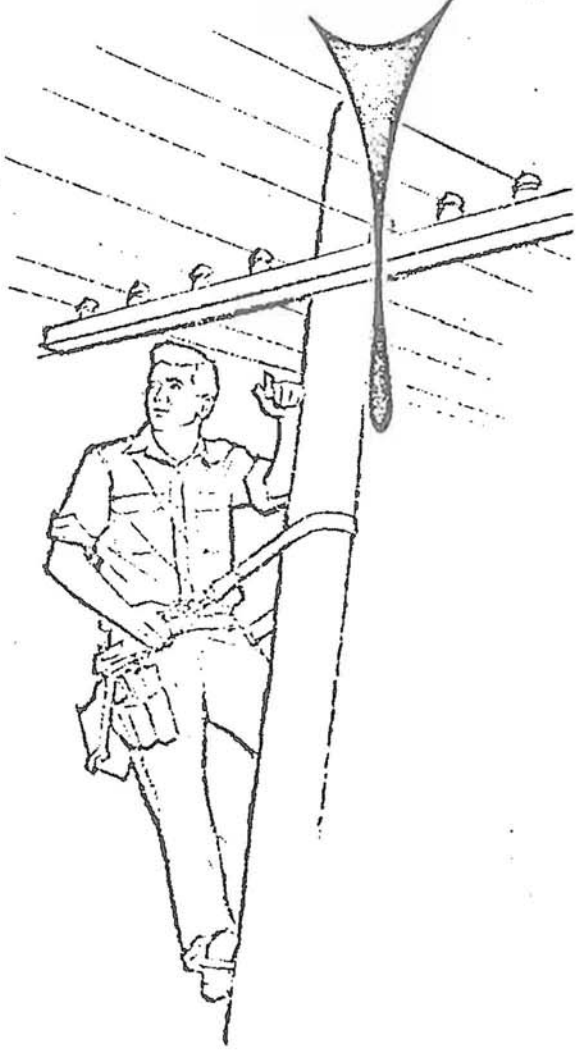
industrial applications of the aroclors



0509830

Aroclors are among the purest commercial chemical compounds, virtually free of even traces of conducting impurities. For this reason, the Aroclors' dielectric properties closely approximate the theoretical maximum for the particular organic compound. With their stability, heat resistance and flame resistance — Aroclors can be used for a variety of heavy-duty dielectric applications.

electrical applications of aroclors



DIELECTRICS FOR ASKAREL TYPE TRANSFORMERS AND CAPACITORS

Monsanto Aroclors are used *per se* and are formulated for the liquid coolant-insulation fluids in transformers and capacitors. Such dielectrics must be highly pure with dependably minimal traces of electrolytes. They must be chemically stable and non-corrosive to a wide variety of structural materials. Most important, the dielectric fluid must be fire-resistant.

Aroclors are the only liquids in low cost commercial supply that meet these exacting requirements.

Liquid Aroclors "1242," "1248," "1254," and "1260" are used directly, or these are carefully formulated with chlorinated benzene and other additives to make askarel fluid for particular needs. Typical formulated askarel fluids are shown on the following pages.

Aroclors "1242" and "1254" themselves or in special formulations are used as the dielectric in fixed paper capacitors, for the power factor correction in utility transmission lines; for home appliances such as air conditioners, furnaces, washers and driers; for electric motors; and for ballast in fluo-

0509831

rescent fixtures. There are also a number of applications in DC systems, in condensers, and the new energy storage capacitors.

The Aroclor fluids can be used in a wide variety of applications requiring a specialized dielectric. Monsanto works closely with electrical equipment makers to develop the proper dielectric with the exact physical properties required by the engineering of the equipment.

IMPREGNATING COMPOUNDS

Because of their nonflammability, high resistivity, and dielectric strength and low power factor, the liquid and resinous Aroclors are extremely useful materials for many applications as impregnating compounds. An important application of Aroclors in the electrical field is the use of Aroclors 1260, 4465 and 5460 in wire or cable coatings and as impregnants for cotton and asbestos braided insulation. Because they possess high purity and excellent electrical resistance, Aroclor 1254, 5460 and 1268 make excellent dielectric sealants: to close the pores of carbon resistors, and to seal electrical bushings and terminals.

Since the liquid Aroclors will absorb sufficient moisture from the atmosphere to impair the electrical characteristics, it is customary to treat Aroclor intended for this application before use with a dehydrating clay. An effective product for this purpose is Attapulgus clay 80/300 mesh dried for 4 hours at 400°C. and used at the rate of 0.10% based on the weight of Aroclor, followed by filtration. Treatment is improved if the Aroclor is heated to 50-55°C.

00088

Because Aroclors have excellent shear resistance, heat stability, and are chemically stable . . . they can serve in dozens of mechanical applications for transferring mechanical power, heat, and variable pressures. Aroclors do not attack metals even at high temperature; they resist oxidation, chemical and mechanical breakdown under a wide variety of environmental conditions. In addition, the Aroclor liquids used as lubricants impart a high degree of extreme pressure lubricity.

mechanical applications of aroclors

HEAT TRANSFER

Aroclors are outstanding for use as the heat transfer liquids in indirect heating systems. Aroclor systems can transfer closely controllable, uniform heat to chemical processing vessels, food cookers, potato chip fryers, drying ovens and other installations where the fire source must be removed from the point where the processing heat is used. Aroclor 1248 is used most frequently in such indirect heating systems.

Heat transfer with Aroclors has many advantages. Processing heat up to 600°F. can be delivered in a *non-pressurized* system, reducing the construction costs of the heating system. The fluid in properly engineered systems will last without significant degradation for from five to seven years. The systems present no fire or explosion hazard, since the Aroclor does not support combustion. In addition, there is no day to day conditioning of boiler water, inasmuch as the Aroclor requires no conditioning, and Aroclor systems require a minimum amount of insulation. Aroclor systems operating at atmospheric pressure have been used successfully since 1941. Aroclor systems can operate safely and efficiently on gas, oil or electricity.

0509835

00089

Aroclors 1242, 1248 and 1254 are used as a circulating heat transfer medium with great success. Good circulation and a well designed heating system are necessary to prevent local overheating. Aroclor 1248, however, is recommended for universal use up to 315°C (600°F) because of its fluidity at low temperatures and its fire-resistance. The liquid Aroclor 1248 is readily pumpable with centrifugal pumps to temperatures as low as 50°F.

In processes where a cooling cycle must also be introduced, provision can easily be made for shunting circulating Aroclor through a water cooled heat exchanger, thus employing one medium for both heating and cooling.

In special cases, Aroclors 1242 and 1232 can be substituted for the Aroclor 1248. If low outside temperatures are encountered, the less viscous Aroclor 1242 can be used.

Aroclor 1232 may be used where outdoor temperatures as low as 20°F are encountered. While Aroclor 1232 is serviceable for unpressurized heat transfer, this Aroclor compound is not quite as fire resistant as "1248" or "1242."

Monsanto has available an "Engineering Heat Transfer Data" booklet that gives design guidance on Aroclor systems. In addition, Monsanto can suggest sources for Aroclor heaters and equipment.

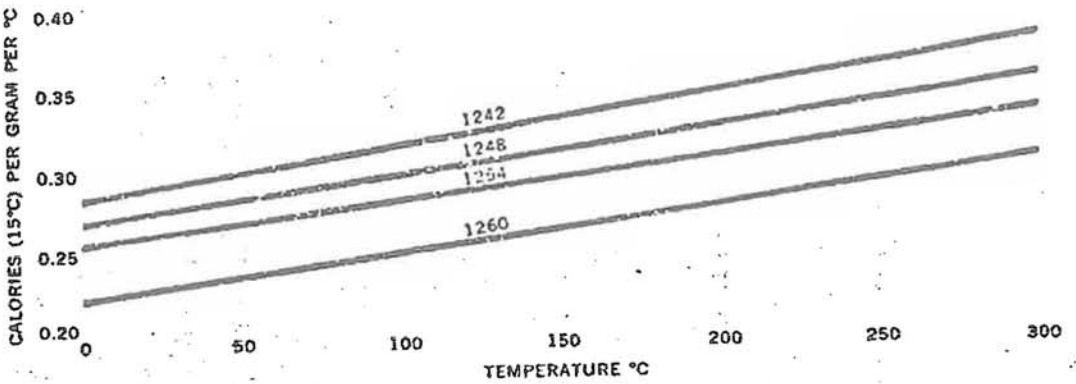
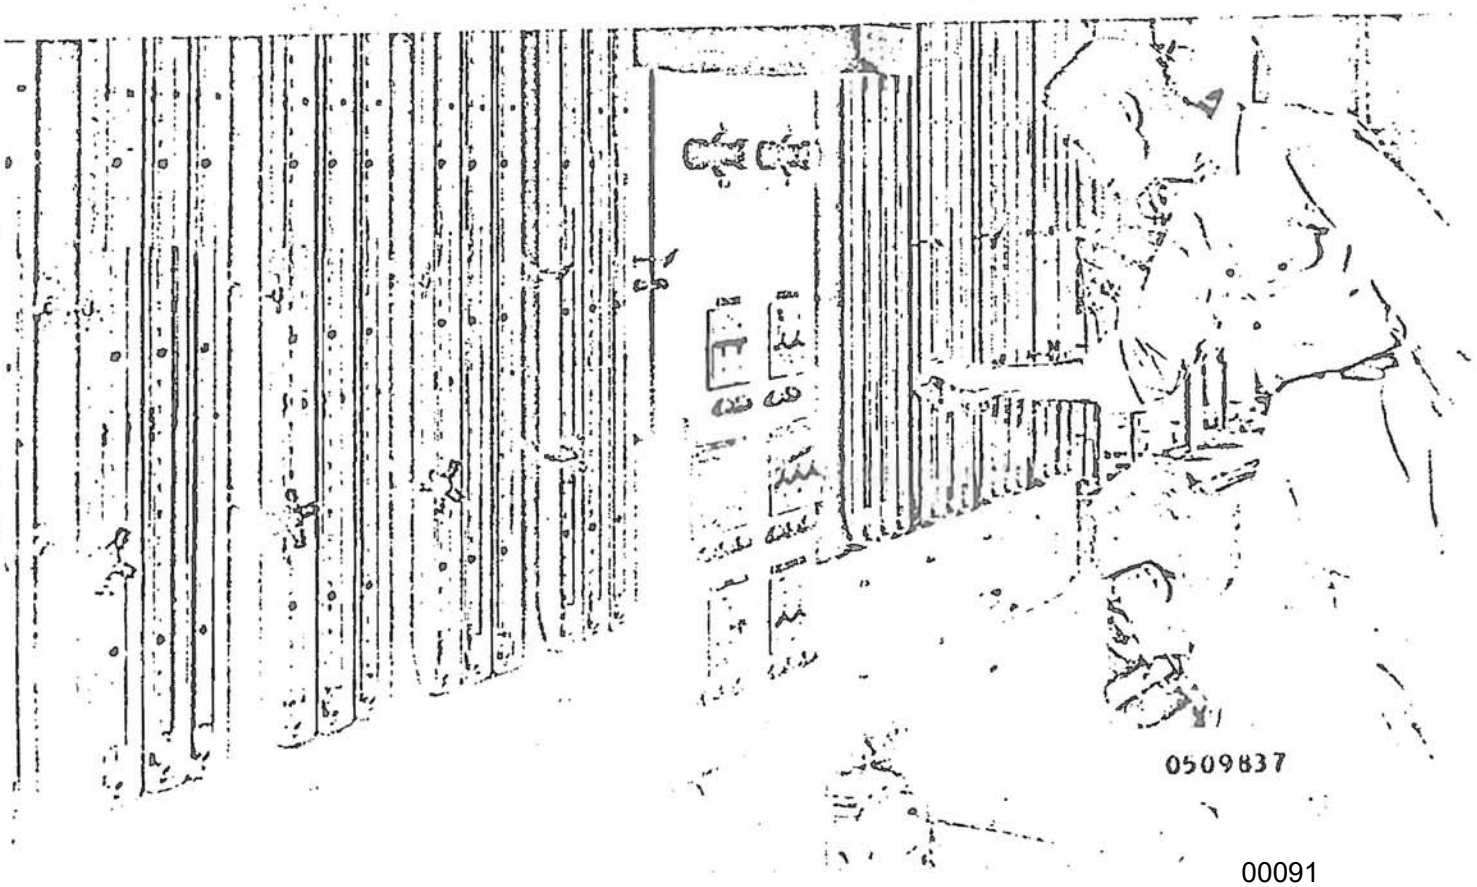
HEAT CAPACITY OF AROCLORS
AT VARIOUS TEMPERATURES



THERMAL CONDUCTIVITY OF AROCLOR 1248

Temperature °C.	Temperature °F.	BTU./Hr./Sq. Ft./°F./Ft.	Calories, gram/Sec./Sq.Cm./°C./Cm.
30	86	0.0570	236×10^{-4}
60	140	0.0564	233×10^{-4}
100	212	0.0555	229×10^{-4}



EXPANSION MEDIUM

Because of their stability at high temperatures and ability to withstand frequent temperature cycles without gum formation, the liquid Aroclors are used as the actuating medium in bellows controls, thermostats, industrial temperature control regulators and other kinds of automation equipment.

The average coefficient of expansion of Aroclor 1248 per degree F. within the various temperature ranges indicated in the table below was determined by using the simple formula $Vt = Vt^1 [1 + a (t - t_1)]$. The coefficient, a, has been calculated at 100°F increments, as follows:

Temp. Range F	Average Coefficient of Expansion cc/cc/F
0 to 100	0.00037
100 to 200	0.00039
200 to 300	0.00040
300 to 400	0.00046
400 to 500	0.00048
500 to 600	0.00051

The specific volume of Aroclor 1248 at different temperatures is as follows:

Temp. °F.	Specific Volume ml/gm
0	0.674
100	0.699
200	0.726
300	0.755
400	0.790
500	0.828
600	0.870

LIQUID SEALANT FOR FURNACE ROOFS

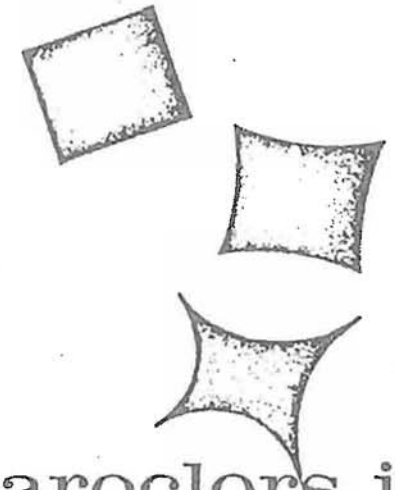
The liquid Aroclors 1248 and 1254, because of their low vapor pressures and fire-resistance, make excellent liquid sealants. These non-evaporating fluids have good flow at slightly elevated temperatures and are chemically stable at elevated temperatures. Consequently, the liquid Aroclors make excellent fluid sealants for any application where the use of oil would create a fire hazard. In the trough of annealing furnaces, for example, Aroclors make dependable fire-safe roof seals.

VACUUM DIFFUSION PUMP OIL

The fluid Aroclors 1248 and 1254 are highly stable to air; they make good oils for vacuum pumps at a much lower cost than high priced silicone type oils. These Aroclors operate efficiently in vacuum diffusion pumps used to pull high vacuum for metalizing plastics; dehydrating foods, medicinals; and for drying capacitor cones.

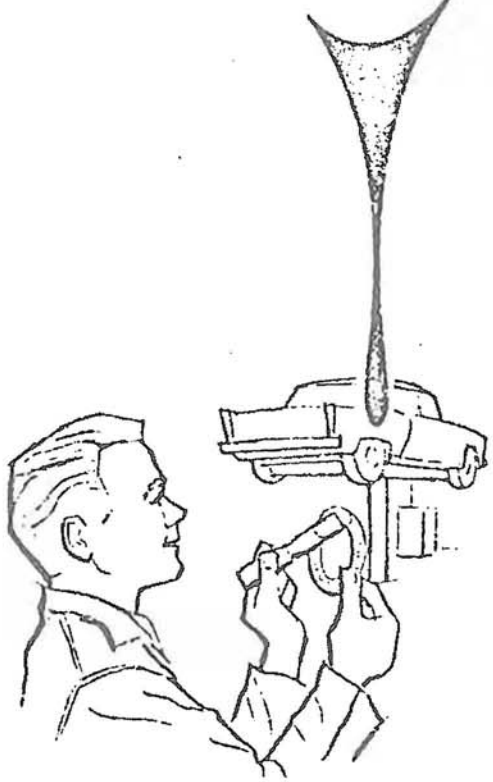
DUST ENTRAPMENT

Because Aroclors are non-drying and tacky, they make excellent coatings for capturing dust, lint and other fine air-borne particles. Aroclors 1260 and 5460 are used successfully to coat fibrous glass air filter pads, metal mesh and other materials used for filtering air and gas streams.



With their wide range of physical properties, their inertness, lubricity, and vapor-suppressing characteristics — Aroclors can be valuable ingredients in an extraordinary variety of formulated products. They are compatible with a variety of solvents, oils, resins. They are virtually non-volatile and permanently thermoplastic; they will not react with other chemicals in the formulation. In addition, their low cost makes their use for special purposes eminently practical and economical.

aroclors in special product formulations



SEALERS FOR GASKETS

Aroclors — particularly when hot — swell rubbers like Hycar, Koroseal, PerBuna N, and Neoprene. Wherever seals and gaskets of natural or synthetic rubber tend to shrink under heat and use, Aroclors 1232, 1242 or 1254 can be used as a swelling agent to tighten the shrunken seal. An example is in automotive transmission oil: a small amount of Aroclor in the oil swells the seal *in place*, saving the cost of tearing down the equipment to replace the seal or gasket. Aroclors can be used in gasket sealing compounds to swell the rubber after the gasket or seal is in place.

DEDUSTING AGENT

Aroclor 1254 is a low cost dedusting agent which can "hold down" the dusting of a variety of chemical products. Because Aroclor 1254 resists both combustion and oxidation, it can be used to control dusting of highly reactive compounds. As a typical example,* a few tenths of one percent will control the dusting of calcium hypochlorite.

*Covered by U. S. Patent No. 2,921,911, issued January 19, 1960, and assigned to Pennsalt Chemicals Corp.

0509839

Aroclor 5460 and 1254 act as vapor suppressants. The United States Department of Agriculture scientists reported that the inclusion of from 5 to 25 parts per hundred by weight of Aroclor increased the effective kill-life of a lindane spray up to ten times. A painted or metallic surface sprayed with certain chlorinated insecticides fortified with Aroclor will remain toxic to flies, ants, roaches, silverfish up to 2 to 3 months. The Aroclor resins suppress the rapid evaporation of the volatile insecticides without adding odor or other objectionable residue. Formulation into insecticides is quite simple; the Aroclor is dissolved in a suitable solvent compatible with the insecticide formulation, and mixed in. The most pronounced effect for increasing the kill-life of the insecticide is obtained with lindane, chlordane and BHC. Aroclors are recommended for chlorinated insecticide formulations to be used for non-crop spraying. Their low cost makes this use a most practical way to lower the ultimate cost of insect control.

Aroclors are compatible with various natural waxes, such as carnauba and others, including those used to formulate casting wax. Aroclors help impart to the finished casting wax a number of desirable properties: hardness without brittleness; resistance to shrinking; sharp definition; sharp melting point; and fire-resistance. Waxes formulated with Aroclors are non-tacky and highly stable. Aroclor-containing waxes are widely used in making dental castings, in the precision casting of aircraft parts, and for casting costume jewelry. Aroclors 1254, 4465 and 5460 are the ones most frequently used, the proportions dependent upon the properties required in the finished wax. Much of the highest quality precision casting wax used in the "lost wax" process is formulated with Aroclors.

Aroclors 1254, 1268 and 5460 are used in the manufacture of specialized abrasives. Because of their excellent bonding characteristics, high thermal stability and resistance to oxidation and corrosion — Aroclors are used as the carriers for abrasive materials. A major use is as part of the bonding agent in specialized grinding wheels.

For specialized lubricants requiring good extreme pressure (EP) characteristics, the liquid Aroclors make excellent additives. The Aroclors impart high temperature stability, excellent lubricating qualities, and weather and corrosion resistance. As an example, Aroclors are used to formulate grease and pipe thread compounds for use in oxygen systems. Greases formulated with Aroclors have a high chemical resistance, are suitable for use in contact with corrosive chemicals. Gear oil lubricants containing Aroclors have good resistance to sheer degradation and high

temperature stability. Added in small amounts to railroad car journal box oils, Aroclors impart better extreme pressure lubricity and reduce the incidence of "hot boxes."

The heat-resisting, nonflammable characteristics of the Aroclors make them attractive in themselves as lubricants under conditions of high temperature. As an example: in governor systems of central power stations, Aroclor 1248 is well suited to this lubricating application.

Straight Aroclor 1254 gives excellent results on a roller bearing test operating at 255-260°F with much less carbonization or decomposition than the usual spindle oil under the same conditions.

As an extreme pressure (EP) lubricant base added to a petroleum hydrocarbon oil in amounts up to approximately 15% by weight, Aroclors 1248 and 1254 materially increase the load-carrying properties without reducing the viscosity of the resulting composition. These two Aroclors represent one of the more satisfactory carriers for the element chlorine as an extreme pressure base, possessing the following advantages:

1. **STABILITY** . . . even at higher temperatures, which assures there will be neither separation of components nor appreciable change in physical or chemical properties during long periods of operation.
2. **NON-VOLATILE.** Many other types of chlorine bearing compounds are so volatile as to render them unfit for long periods of service. The Aroclors are non-volatile at normal temperatures.
3. **NON-OXIDIZING.** Aroclors do not oxidize nor "thicken up" to an objectionable degree.
4. **NON-CORROSIVE** . . . toward metal surfaces.
5. **NON-ABRASIVE.** Aroclors exerts no abrasion on the machined surfaces.
6. **NON-HYDROLYSIS.** Aroclors do not hydrolyze in the presence of water, thus avoiding the generation of hydrochloric acid.
7. **COMPATIBILITY.** Aroclors are completely miscible with mineral oils.
8. **COLOR.** Aroclors do not darken or change the color of lubricating oil.

Submerged Lubrication

Under conditions of lubrication subjected to exposure to water displacement such, for example, as lubrication of bridge rollers, a heavier-than-water lubricant can be prepared from mixtures of Aroclor and oil, of which the following are typical examples:

Mix No.	% by weight Oil*	Aroclor 1248	Pour Pt.	Gravity at 15.5°C.	Approx. Pounds Gal.
1	50	50	0°F	1.1263	9.4
2	25	75	+5°F	1.2703	10.6

Viscosity 210°F-160 Saybolt Secs.
Color ASTM 7-8
Flash Point 545°F.
Pour Point 15°F.

*Bright Stock: Gravity API 22-23

0509841

Aroclors in Industrial Cutting Oils

Aroclor 1254 is used to formulate the finest quality "straight" and "soluble" or emulsifiable-type cutting oils. The Aroclor functions as an excellent extreme-pressure lubricant and it is far superior to aliphatic chlorinated hydrocarbons because of its higher order of thermal stability. The heat resistance is most important in cutting oils for machining high grade steel. With Aroclor cutting oils there is a lower degree of hydrolysis which minimizes the staining of the metal.

AROCLORS IN ADHESIVES

Aroclors are outstandingly useful ingredients in the formulation of various types of adhesives. Besides a plasticizing action on the adhesive's resin base, they add valuable properties to the adhesive bond. Aroclors offer a variety of property improvements to adhesives based on polyvinyl acetate, to rubber cements and to hot melt adhesives.

Aroclors strongly resist attack by water, acids, alkalies and other common corrosive influences, as well as microorganism attack. By proper selection of materials, adhesives containing Aroclors can have outstanding resistance to most of the destructive factors that injure bonding properties.

Hot-Melt Adhesives

A typical starting formulation for a cellulose acetate butyrate hot melt adhesive with Aroclor 5460 is:

	Parts by Weight
Half-second cellulose acetate butyrate	35.00
Aroclor 5460	30.00
Dioctyl phthalate	15.00
Newport V-40	19.89
Santonox*	0.1
Syn Fleur #6	0.01

The above coating can be applied at about 350°F. Ventilation should be provided.

A typical starting formulation for an ethyl cellulose hot melt adhesive with Aroclor 5460 is:

	Parts by weight
Ethyl cellulose, 50 cpr	24
Aroclor 5460	7
Lopor No. 45 Mineral Oil	57
Bakers No. 15 Castor Oil	5
Epoxy soybean oil	3
Paraffin wax (m. p. 135°F)	3
Santonox*	1

*Santonox: Monsanto Chem. Co. trademark, Registered U. S. Pat. Ofc.

0509842

00096

Heat Sealing Adhesives

Chlorinated rubber and Aroclors 1254 and 1260 make excellent heat sealing and label adhesives. These adhesives have high chemical resistance and extremely low moisture vapor transmission. A typical starting formulation is:

	Parts by weight
Parlon (125 centipoise type)	20
Aroclor 1254	6
Aroclor 5460	6
Toluene	68

PVAc Emulsion Adhesives

Aroclors 1221, 1232, and 1242 impart excellent tack and strong bonding power to polyvinyl acetate emulsion adhesives. They readily blend with simple stirring and since they are liquid at room temperature no pre-melting is required. The hardness required in the adhesive's end use can be varied to suit simply by selection of the Aroclor without materially changing other properties. The Aroclors are compatible with PVAc emulsions at a level of up to 11 parts of Aroclor in 100 parts of PVAc emulsion.

An excellent type of hot melt book binding adhesive can be made as follows:

	Parts by weight		
	Formula 17	Formula 18	Formula 19
Gelva polyvinyl acetate resin V-7	100	65	—
Ethyl cellulose	—	15	—
Gelva C-SV-16R	—	—	100
Santicizer 160	—	16	—
Rosin WW	75	—	75
Dibutyl phthalate	30	—	30
Aroclor 1254	55	4	55

By changing the type of polyvinyl acetate resin utilized in the hot melt, the viscosity of the melt can be increased or decreased without changing the ratio of resin to plasticizer.

Polyurethane Resin Adhesives

An excellent flocking adhesive containing Aroclor 1254 can be made as follows:

		Parts by weight
Part A —	Multranil FLD*	100
	Aroclor 1254	20
	Mondur *C	5
Part B —	Multranil FLD*	100
	Mondur C*	5-10

Part A is applied to the fabric by knife coating and allowed to dry thoroughly. The fabric is then coated with Part B, and the material is flocked immediately.

*Mobay Chemical Co. trademark, Registered U. S. Pat. Off.

0509843

Epoxy Adhesives

Aroclors can be used to extend epoxy resin adhesives. The extending greatly reduces the formulation cost with a minimum effect on the bonding characteristics of the adhesive.

Aroclors can be used to extend or substitute Carnauba Wax and reduce the cost of the wax formulation. Several practical formulas are available using Aroclors to make wax blends that possess the qualities of Carnauba Wax. These blends can be used for automobile, wood, leather and linoleum polishes.

Selected Aroclors such as 5460 used in conjunction with various waxes make excellent impregnating compounds for furniture drawers, etc., to prevent sticking.

Resinous Aroclors used in combination with waxes make excellent and inexpensive sealers for concrete and masonry surfaces, wood, fiber board and paper products.

The Aroclors may be used to impregnate cloth, paper, wood or asbestos in order to impart moisture and gas resistance, adhesion, insulating properties, alkali or other chemical resistance, flame resistance, or lubricating qualities. For this type of formulation they are used in combinations with other materials such as waxes, inorganic pigments, asphalt, tars, aluminum stearate, sulphur, etc., in order to obtain exactly the physical characteristics desired for the specific purpose. Aroclors 1254, 4465 and 5460, or the corresponding dark-colored products, are suggested as most applicable.

Wood impregnated by vacuum-pressure method with the following mixture:

Aroclor 4465	70%
Microcrystalline Wax	20%
Sulfur	10%

. . . is definitely tougher, harder and more moisture resistant than untreated wood. This coating is very resistant to acids and alkalies but will be attacked by aromatic, aliphatic or chlorinated hydrocarbons. The surface is not appreciably discolored and can be painted. Various degrees of hardness and adhesion can be obtained by varying the Aroclor: wax: sulfur ratio.

0509844

For use as moisture-proof coatings on wood, paper, concrete and brick, the Aroclors are best combined with waxes, especially paraffin or Carnauba, oils such as mineral oil or drying oils, and synthetic resins including modified alkyds, phenolics, chlorinated rubber, polystyrene, styrene-butadiene co-polymers, ethyl cellulose, cellulose acetobutyrate, benzyl cellulose or vinyl resins. Selection of materials for use in combination with Aroclors depends on end use requirements of the specific application.

The simplest compositions contain only Aroclor and paraffin. A moisture proofing compound composed of 96% (by weight) of Aroclor 5460 and 4% paraffin (melting point 54°C) has an ASTM softening point of about 82°C and is very efficient. Substituting Aroclor 4465 for Aroclor 5460 produces a compound with a softening point of about 58°C.

Softening point and viscosity when melted may be further decreased by using mixtures of Aroclors. For example, a composition containing 40% of Aroclor 1260, 56% of Aroclor 5460 and 4% of paraffin will be very soft at ordinary temperatures. Increased proportions of paraffin will also produce softer compounds.

An excellent melt coating for paper and cloth was reported by W. M. Gearheart and F. M. Ball, OFFICIAL DIGEST, Vol. 343, 1953:

Half-second Butyrate	50%
Dioctyl phthalate	9.9%
Aroclor 1260	40%
Ionol	0.1%

This coating may be applied by knife or roller at 350°F; the applicatio. requires no solvent. This coating on paper or fabric has extremely good flexibility.

Aroclor 4465 is a useful resin for compounding rotogravure and other printing inks. A mimeograph ink suitable for use on bond paper contains the following ingredients:

Aroclor 4465	40%
Lubricating Oil (SUV 1200 @ 100°F)	35%
Paraffin Oil (SUV 76 @ 100°F)	20%
Carbon Black	4%
Oil Soluble Dye	1%

Aroclor 4465 may also be used in the preparation of imitation gold leaf. A thin coating of the Aroclor is applied hot to one side of paper. While it is still hot, bronze powder is spread upon the coating. The bronze powder adheres to the Aroclor completely covering the paper. This product is used in making the "gold

0509845

00099

leaf" letters on books, etc. The paper treated with Aroclor and bronze powder is placed upon the book binding. A hot die is pressed upon it. The Aroclor softens and sticks the bronze to the binding and forms a coating over it to protect it from tarnishing.

The Aroclors are also used as vehicles for carrying the pigments used in glass decoration. When the decorations have been applied and the glass is fired, the Aroclors volatilize without carbonization and thus avoid discoloration of the glass. Aroclors 1254 and 4465 are used for ceramic decoration.

PAPER TRANSPARENTIZER

A treating liquid that makes paper transparent for use as tracing paper, window envelopes, and special packaging can be formulated with Aroclor 5460 and polybutenes. A typical economical formulation is:

Aroclor 5460	30%
Indopol H-300	25%
Toluene	45%

In the paper treating formula, the proportions of Aroclor to Indopol may be varied from 2:1 to 1:2 respectively.

MASTICS, SEALING AND CAULKING COMPOUNDS

Aroclors and polybutenes can be blended with inorganic fillers to make excellent sealing and caulking compounds. A typical "filler" would be:

Whiting	50%
Talc	30%
Lithopone	10%
7 M Asbestos	10%

By combining selected Aroclors and Indopol polybutenes, it is possible to produce a wide range of hardness, viscosity, flow and bonding characteristics in durable sealing and caulking compounds.

Excellent mastics, too, can be prepared by blending selected Aroclor resins with Indopol polybutenes. The mastics have good adhesive qualitites for specialized uses such as sealing of automobile body construction.

PERMANENT TACK COATINGS

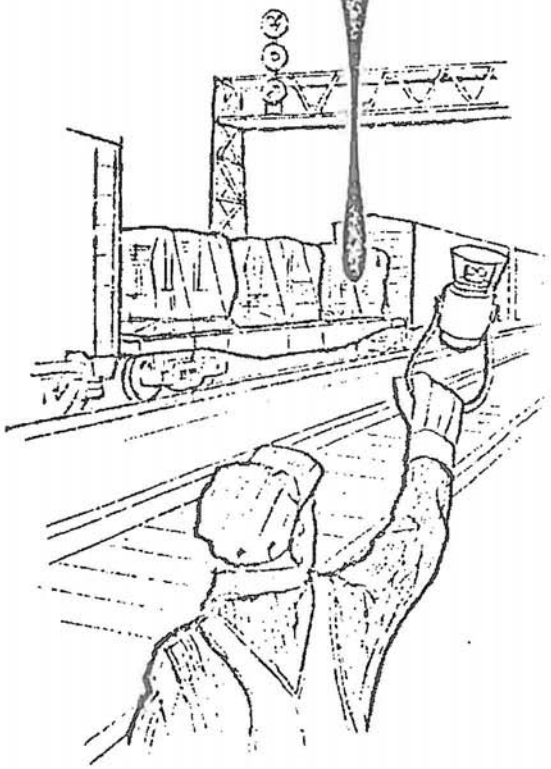
Aroclors and Indopol polybutenes can be blended in a variety of proportions to make permanently tacky coatings. These coatings may be applied to fabric or paper to provide a permanently "sticky" surface. Insecticides, for example, can be blended into such coatings to make insect traps or insect barriers on tree trunks for tree foliage or fruit protection. These coatings can also be used for tapes and sign backing.

0509846

00100

Aroclors are valuable as low cost plasticizers for a variety of applications. Aroclors improve chemical resistance, flame retardance, oxidation resistance, and reduce the cost of plasticized elastomers. Depending upon the use, the various Aroclor compounds offer a number of benefits to the user.

aroclors in plastics



In almost all formulations, the use of a selected Aroclor as a plasticizer reduces the cost per pound of the formulation.

Another valuable use of Aroclors in the plastics field is as a grinding and dispersing medium for pigments.

The Aroclor compounds are compatible with most common plastic materials; they are compatible to the extent of practical use with the following:

Asphalt
Benzyl Cellulose
Carnauba Wax
Cellulose Acetate Butyrate
Chlorinated Rubber
Coumarone-Indene Resins
Dammar Resin
Ester Gum
Ethyl Cellulose
Epoxy Resins
Manila Gum
Nitrocellulose
Paraffin
Phenolic Resins
Polyethylene
Polyester Resins
Polystyrene Resins
Polyiso-Butylene
Polyurethanes
Polyvinyl Acetate
Polyvinyl Chloride and
Polyvinyl Butyral
Polyvinylidene Chloride
Rosin
Rubber
Styrene Butadiene Co-Polymers
Vinyl Resins

0509847

00101

Aroclors are not compatible with cellulose acetate or with phenolic resins in the final stage of condensation.

In selecting the proper Aroclor for a given use, the degree of *flexibility* imparted increases progressively in the order of: hard resinous Aroclor, soft resinous Aroclor, liquid Aroclor. Conversely, the *hardness* of the plasticized elastomer increases progressively with the choice of: liquid Aroclor, soft resinous Aroclor, hard Aroclor resin.

POLYVINYL CHLORIDE

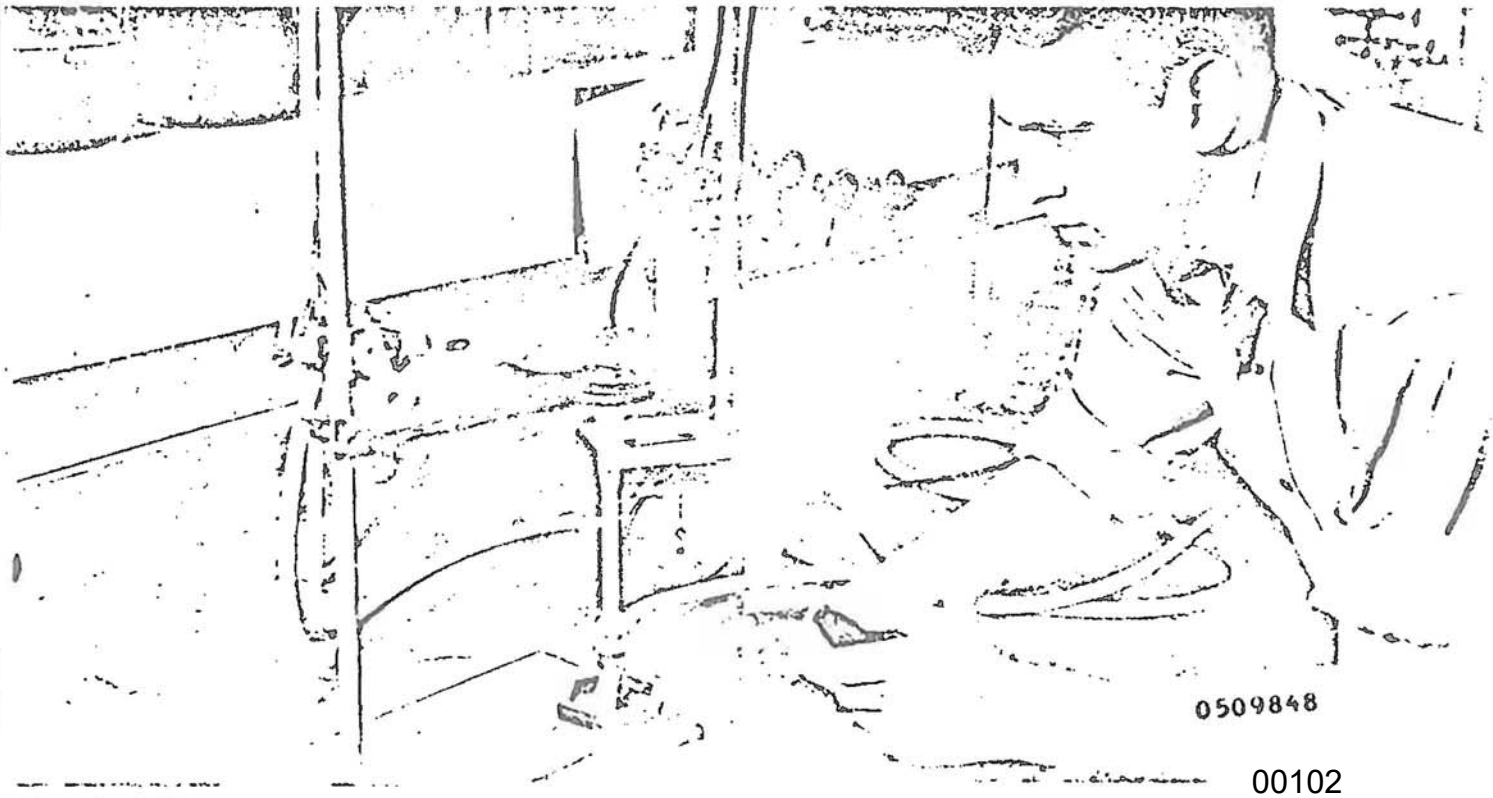
The Aroclors are valuable as secondary plasticizers, or plasticizer-extenders for polyvinyl chloride formulations. The Aroclors impart greatly improved chemical resistance over conventionally ester-plasticized compositions. For example, a formulation plasticized with 3 parts of DOP and 1 part of Aroclor 1254 shows the best chemical resistance of any plasticized polyvinyl chloride formulation evaluated to date.

Aroclor 1262, when used as a co-plasticizer with DOP, greatly reduces the amount of migration of the plasticizer to nitrocellulose lacquers. Aroclor 5460 is frequently used as a plasticizer-resin-extender to make flameproof vinyl tiling compositions.

In vinyl chloride co-polymer resins for solution application, the combination of Aroclor 5460 and Aroclor 1254 is widely used because of its outstanding chemical resistance.

RUBBER—NATURAL AND SYNTHETIC

The liquid Aroclor compounds — 1221, 1232, 1242 and 1248 — have a strong plasticizing action on rubber, both natural and synthetic. Aroclors 1254 and 1260,



when milled into rubber, impart permanent tackiness and adhesion to the composition.

Aroclors 2565, 4465, 5460 and 1268, when incorporated in neoprene rubber in amounts as high as 40 parts per 100 parts of rubber make compositions that are extremely flame retardant.

The Aroclors generally show a high degree of compatibility with epoxy resins; this group of materials is one of the very few plasticizers that possess such high compatibility with these materials. The lower Aroclor numbers, 1221 and 1232, impart a high degree of flexibilizing to epoxy compounds. The more resinous and solid Aroclors have little effect on the flexibility of the compound; in fact, they tend to act as reinforcing materials. Aroclors have little effect on epoxy resins' hardness, tensile or compressive yield strength. The ultimate compressive strength can be improved by using solid Aroclors in phthalic anhydride cured systems.

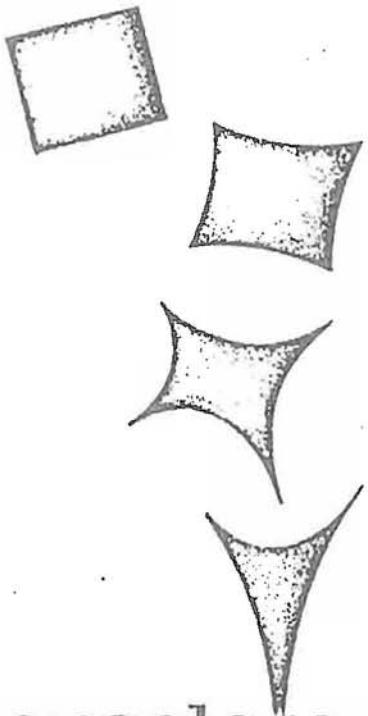
All of the Aroclors, when used at a rate of 15 to 20 parts per hundred of resin, greatly retard the burning rate of epoxy compositions. If a small amount of antimony oxide is added in addition to the Aroclor compounds, the materials then become non-burning.

Aroclor 5460, when used in low density polyethylene to the extent of 20% — in combination with 10% antimony oxide — makes the compound self extinguishing. Compared to other materials that make polyethylene self extinguishing, Aroclor 5460 has much less effect on tensile, yield and elongation properties. In addition, the heat stability of the Aroclor compound is greatly superior to the other materials commonly used to make polyethylene self-extinguishing.

Incorporation of the solid, resinous Aroclors will make asphalt self extinguishing. Possible applications of this type of formulation include caulking compounds, roofing compounds and sound-deadening coatings. Normally, 30% of an Aroclor such as 5460 will make an asphalt mixture that is self extinguishing.

Incorporation of Aroclor in a polyester resin in combination with antimony oxide greatly reduces the burning rate of polyester resins. A mixture of sufficient amounts of selective Aroclors will produce polyesters that are self extinguishing.

Considerable interest has been displayed in the use of Aroclors in phenolic laminating resins, to make compounds that are flame resistant. Normally, the higher molecular weight Aroclor, such as Aroclors 1260, 1262 and 5460 are evaluated for this purpose.



Aroclors are soluble in paint and varnish oils and solvents and are compatible with most film-forming coating resins. The Aroclor compounds improve adhesion to the substrate. Adding Aroclors to paint, varnish or lacquer formulations imparts properties to the film that correspond to the particular character of the Aroclor used. The hard, resinous Aroclors tend to give increased hardness to films; the viscous Aroclors impart flexibility.

Aroclors are excellent grinding and dispersion media for pigments used in paints and varnishes. Aroclor 1254 is used to disperse aluminum powder in a paste form which can be incorporated easily into paints and varnishes. The Aroclor imparts excellent leafing qualities, brightness or luster and does not tarnish the aluminum pigment on aging. Moreoever, the coating composition does not support combustion.

aroclors in paint, varnish and lacquer formulations

VARNISHES AND ALKYDS

Aroclors 4465 and 5460 will produce paints that are very quick drying and yet have excellent durability. The weight of Aroclor used may be from 30% to 50% of the weight of the oils.

The Aroclors do not react chemically with oils, hence there is no advantage in heating together in making a varnish. They are best added as a "chill back" or as a cold cut in the thinning operation. As far as incorporation of the Aroclors is concerned, the only reason for heating is to make the Aroclors liquid so they can be more readily mixed with the oils.

Aroclor 1260 is best for short oil varnishes that are required at the same time to be flexible. The Aroclors impart water and alkali resistance, and with these qualities enhance the value of the other resins used in the varnish. The suggested starting formulation is two parts by weight of oil, one part of Aroclor 1260 and one part of other resin. These

0509850

Aroclor 1254 in yellow traffic paint.

00104

proportions can be varied as required. The Aroclor may be considered to function in the formulation as an oil, with the difference that it does not oxidize and lose its flexibility.

Resins of the alkyd, phenolic or ester gum type, with a harder Aroclor such as 5460, may also be used in making varnish formulations.

EPOXY RESIN COATINGS

The high compatibility of Aroclor compounds with epoxy resins makes these materials of great value in formulating epoxy coatings. Normally, 10 to 15% of Aroclor 1260 or 1262 is added to the epoxy composition to improve flexibility with a minimum effect on the corrosion resistance and adhesive characteristics of the film.

NITROCELLULOSE COATINGS

In pyroxylin or nitrocellulose lacquers, the Aroclors can function both as plasticizers modifying the properties of the film and as film-forming bodying resins. Aroclors are highly compatible with nitrocellulose and with other resins and plasticizers commonly used in lacquer formulating. They impart weather resistance, luster, adhesion and decreased burning rate. The Aroclors' excellent electrical characteristics (high dielectric strength and resistivity and low power factor) and their property of retarding the passage of moisture and gases through nitrocellulose make the Aroclors of special value in coatings for electrical insulating materials.

To illustrate the modification possible to obtain by changes in formulation, three lacquer formulas are given below. All have excellent durability but the third is much softer and more flexible than the other two. Only the solids contents are given. The amounts tabulated are parts by weight.

Aroclor Lacquers

	No. 1	No. 2	No. 3
½ second Nitrocellulose (dry)	100	100	100
Dammar resin	80	—	—
Ester Gum	—	80	—
Aroclor 1260	20–39	20	80–70
Dibutyl Phthalate	20–0	20	—
Tricresyl Phosphate	—	—	39–70

No. 1 and No. 2 have excellent sanding and polishing qualities. No. 3 is very flexible but too soft for sanding.

Where extremely high flexibility is desired, as for example in lacquers for high tension automotive cables, the following composition is suggested:

15-20 second R. S. Nitrocellulose	100 parts by weight
Tricresyl Phosphate	120 parts by weight
Aroclor 1242	80 parts by weight

The accompanying trilinear diagrams show the practical compatibility limits of Aroclors 1254 and 1262 when used in combination with some other resins and plasticizers. Aroclor 1260 gives values almost the same as those shown for 1262. The less viscous Aroclors have greater compatibility; the more resinous Aroclors have less compatibility than the ones shown.

0509851

00105

In the trilinear diagrams, the compositions, represented by any point in the unshaded areas, are those which produce homogeneous lacquer films. On the other hand compositions represented by points in the shaded areas produce impractical, segregated, brittle or soft films. For detailed information as to the derivation and use of these diagrams reference is made to the following articles:

Jenkins & Foster, "Compatibility Relationships of the Aroclors in Nitrocellulose Lacquers," Ind. Eng. Chem. 23, 1362 (1931).

Hofmann & Reid, "Graphical Methods in Lacquer Technology," Ind. Eng. Chem. 20, 431 (1928); "Formulation of Nitrocellulose Lacquers," Ind. Eng. Chem. 20, 687 (1928).

0509854

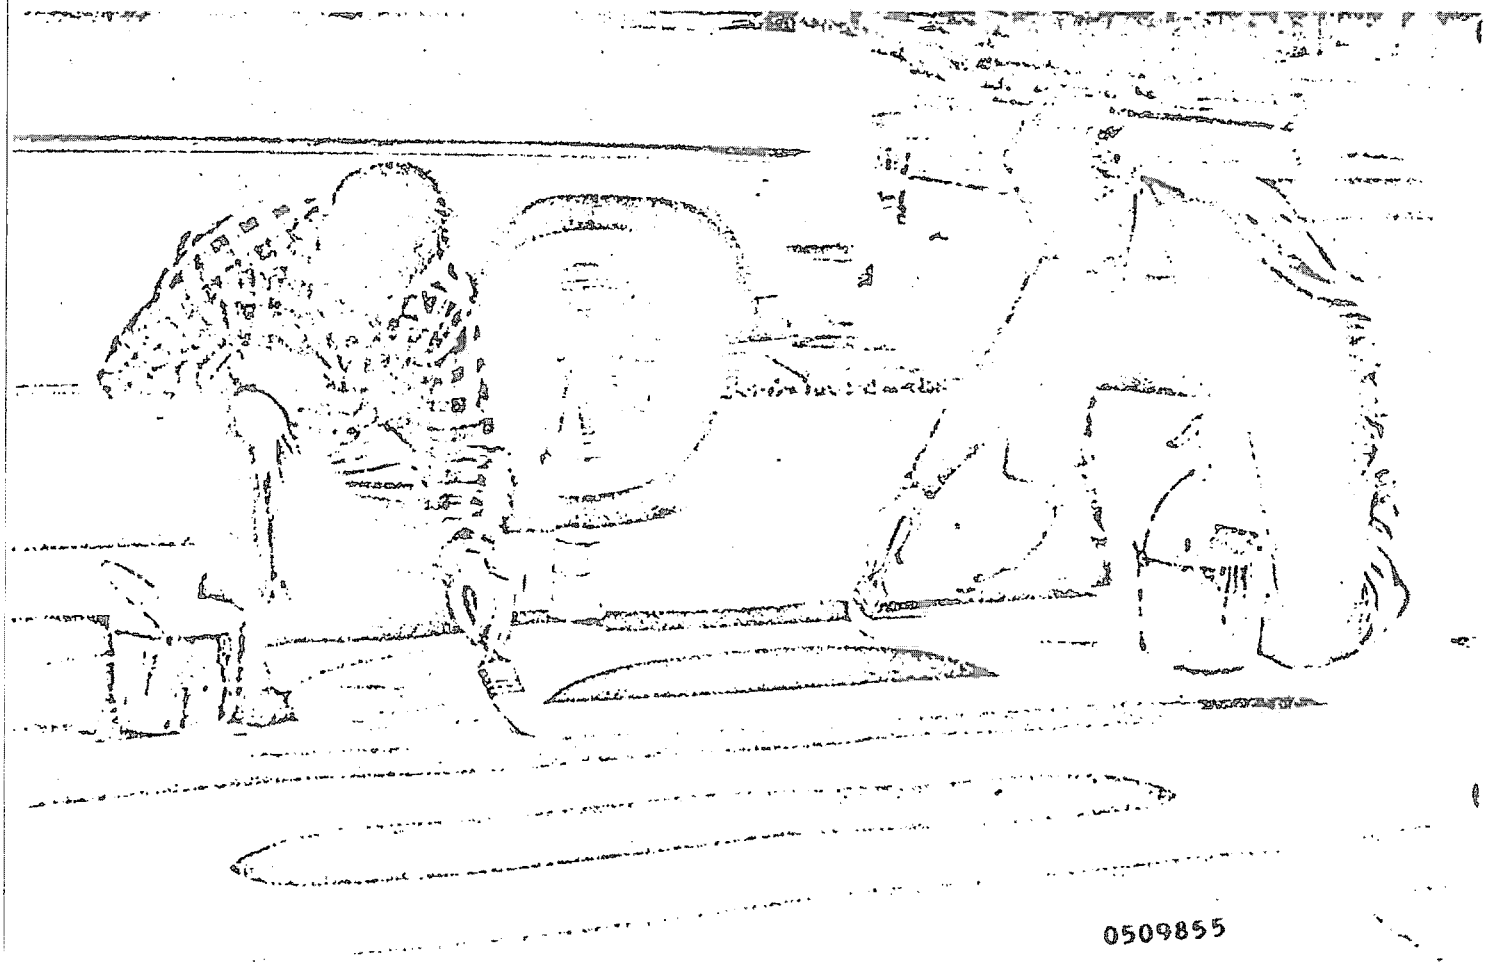
31

00108

CHLORINATED RUBBER AND STYRENE-BUTADIENE COPOLYMERS

Aroclors are outstanding for compounding modified rubber finishes. They impart exceptional corrosion resistance, chemical resistance, oxidation resistance to these coatings, and improve adhesion. Typical applications include masonry coatings for swimming pools, stucco homes and highway paints, as well as protective and decorative coatings for steel structures, railway tank and gondola cars, wood and metal maritime equipment.

In rubber base coatings, Aroclor 1254 is used as a liquid flexibilizing plasticizer and commonly used in combination with Aroclor 5460 which serves as a resin fortifier. The outstanding chemical resistance, corrosion resistance and oxidation resistance of rubber base Aroclor coatings make them outstanding protective coatings for chemical plants, boats, highway marking, and masonry. Monsanto Technical Bulletins No. PL-306, PL-311, and PL-326 cover the use of Aroclors in rubber-base coatings.



0509855

CELLULOSE ACETATE-BUTYRATE LACQUERS

The higher Aroclor compounds are widely used with cellulose acetate butyrate, in the manufacture of low-cost lacquers that are flame resistant. Typical uses for this type of lacquer include paper coating, lacquers for plastics and strippable coatings for paint booths.

A typical paper lacquer with minimum tendency to curl is reported* to contain the following:

	By Weight
Half-second Butyrate	20%
Aroclor 1260	20%
Acetone	10%
Isobutyl Acetate	10%
Ethyl Alcohol	10%
Toluene	30%

ETHYL CELLULOSE COATINGS

The Aroclors are highly compatible with ethyl cellulose. The liquid Aroclors impart great flexibility, the resinous Aroclors impart great hardness. For example, 75 parts by weight of Aroclor 1242 with 100 parts of ethyl cellulose produces great flexibility and a slight tackiness. Aroclor 5460 on the other hand — in the same proportion — produces a very hard and somewhat brittle composition.

For coatings of high gloss and exceptional weathering properties to be applied to rigid surfaces, compositions containing equal parts by weight of Aroclor 5460 and ethyl cellulose are recommended. For more flexibility in the coating one of the softer Aroclors should be used — either alone or as a partial replacement for the Aroclor 5460.

Ethyl cellulose formulations plasticized with Aroclors find end use applications as protective lacquers, adhesives, and as strippable coatings.

The solid Aroclor compounds, such as Aroclor 5460 are widely used in hot melt applications for the protection of tools and metal parts. They are normally used with ethyl cellulose or cellulose acetate-butyrate resins.

CREPE RUBBER COATINGS

Aroclor 1262 is used as a low cost plasticizer for crepe rubber in paint compositions. Used in concentrations of 5 to 50% based on the weight of the rubber polymer, it increases the gloss and alkali resistance of the film and strengthens the adhesion of the film to steel.

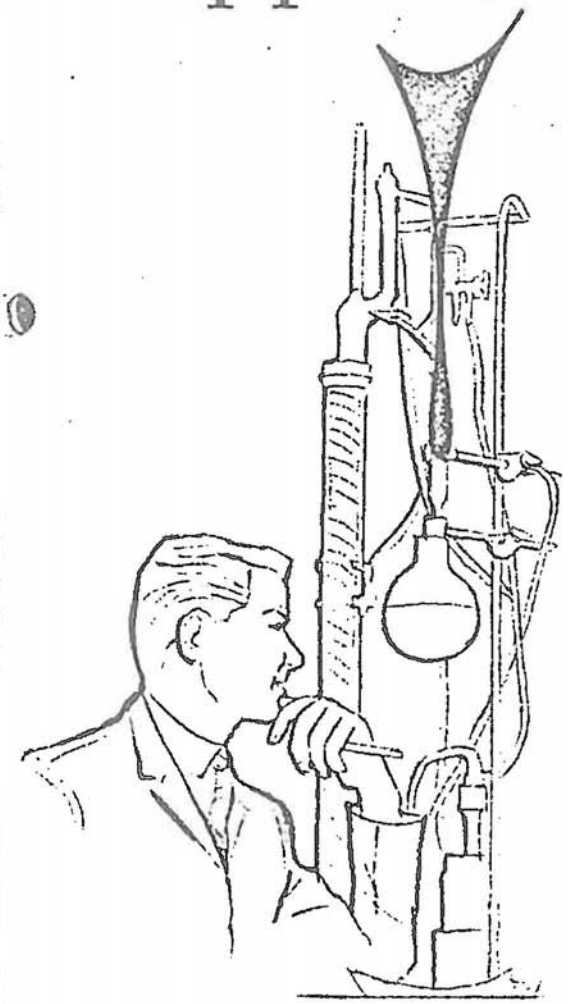
appendix



METHODS FOR EMULSIFYING AND MAKING STOCK SOLUTIONS OF AROCLORS

There are several simple methods for making Aroclor emulsions; the one used may be selected to suit the kind of Aroclor and type of formulation in which it will be used.

Emulsifying Viscous Aroclors

(Portion 1)	16 lbs. of Aroclor 1 lb. of Stearic Acid
(Portion 2)	8 lbs. of water 4 oz. Triethanolamine

Heat the Aroclor to a workable viscosity (180°F plus) and stir in the stearic acid thoroughly. Heat the water to almost boiling (207°F) and stir in the triethanolamine thoroughly. Pour the Aroclor-stearic acid portion *into* the water portion agitating vigorously. Then process the combined portions with a high-speed emulsifying stirrer . . . or process through a colloid mill.

Emulsifying Liquid Aroclors

(Portion 1)	100 parts Aroclor 1254 4 parts Oleic Acid
(Portion 2)	92 parts water 2 parts Ammonium Hydroxide (28%) 2 parts Lustrex° X-810

Mix the ammonium hydroxide and Lustrex X-810 thoroughly in the warmed water, using vigorous agitation. Mix the Aroclor 1254 and Oleic Acid, heat to 45°C and agitate vigorously. Maintain the 45°C temperature and agitation — and add in *slowly* the water portion. Continue agitation for one-half hour till phase inversion is complete.

Emulsifiable Concentrated Stock Solutions of Aroclors

79 parts of Aroclor
16.70 parts of toluene
3.55 parts of isopropyl alcohol
1.00 parts of Sterox° CD (non-ionic emulsifier)
0.75 parts of Santomerse° #3 (anionic wetting agent)

The above formulation is readily emulsifiable with water. If the more resinous Aroclors are used, increase the amount of toluene (or xylene) as needed to dissolve the Aroclor resin.

Meaning of Abbreviations:

°—Based on weight gain calculated as penetration value shown.

RR—Excellent resistance—less than 1.0×10^{-6} cm/day penetration or .00014 in/yr.

R—Good resistance—has penetration between 1.0×10^{-6} and 10×10^{-6} cm/day or between 0.00014 and 0.0014 in/yr.

D—Doubtful resistance, penetration between 10×10^{-6} cm/day and 100×10^{-6} cm/day or between 0.0014 and 0.014 in/yr.

P—Poor resistance—penetration greater than 100×10^{-6} cm/day or 0.014 in/yr.

PS—Poor resistance due to visible local action although weight change indicates greater resistance.

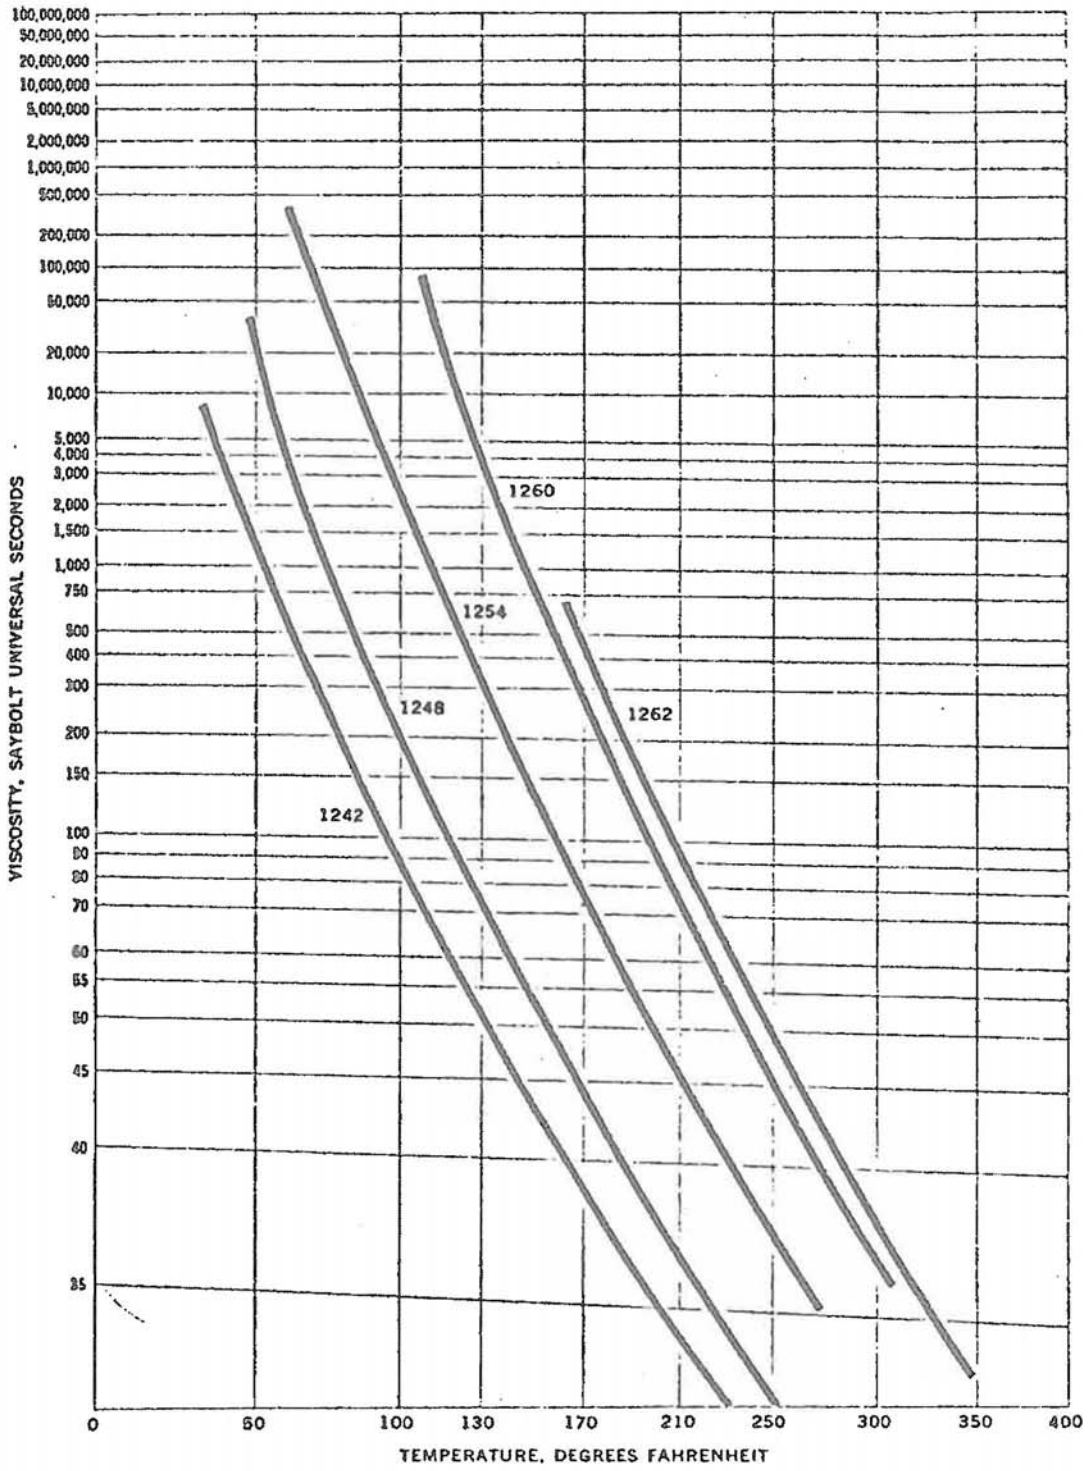
e—Following the letter indicating resistance signifies material may be better than indicated if totally immersed since weight loss is believed to come from oxidation of the part of test strip exposed to air.

T—Material alone will not stand temperature.

0509862

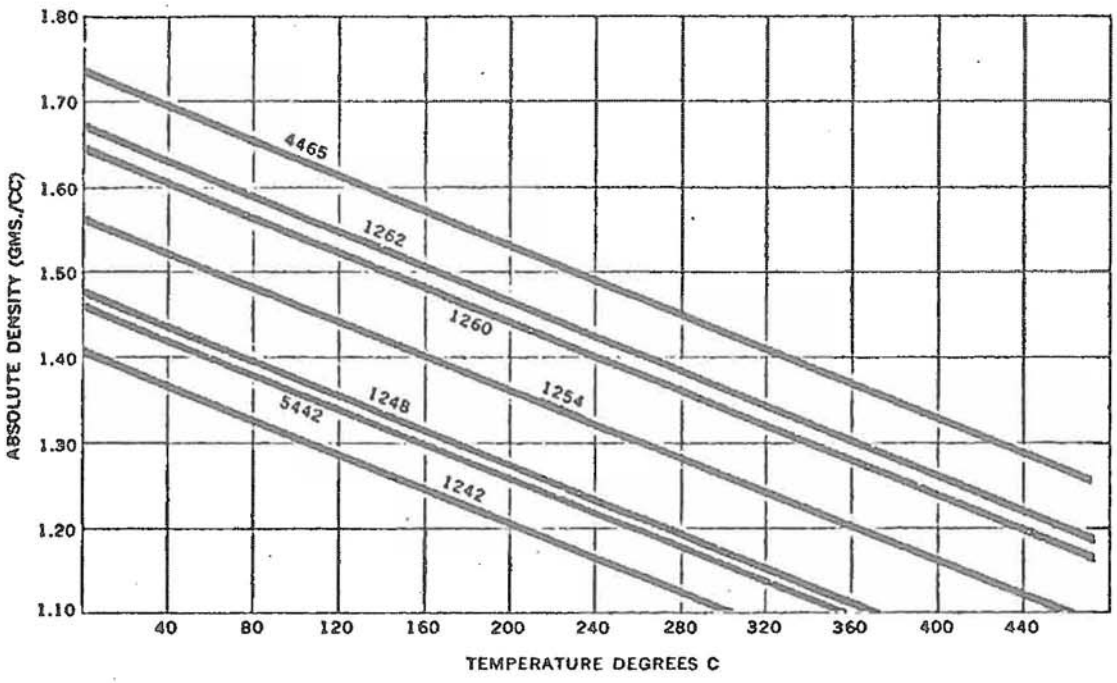
00116

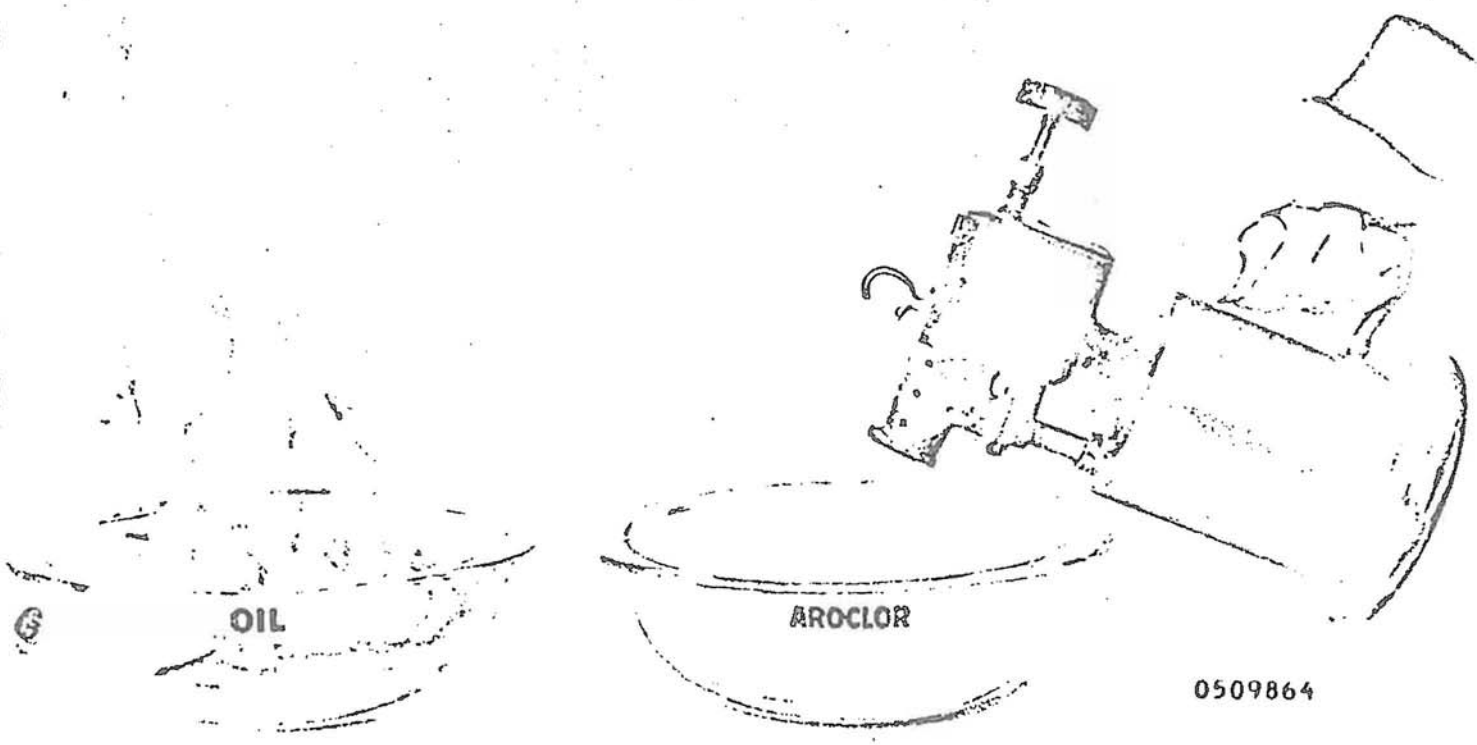
VISCOSITY RANGES OF SOME OF THE AROCLORS



0509863

DENSITIES OF AROCLORS AT VARIOUS TEMPERATURES





00118

At ordinary temperatures Aroclors have not presented industrial toxicological problems. Where Aroclor vapors may be encountered in workrooms, local exhaust ventilation together with general workroom exhaust is recommended.

Skin patch tests with a polyvinyl chloride free film plasticized with 11.5% by weight of Aroclor 1254 (about 25% based on the weight of the vinyl resin) and a similar amount of dioctyl phthalate showed that this film was not a primary irritant or a sensitizer. Skin patch tests with Aroclor 1254 alone applied to gauze and placed in contact with the skin showed no primary irritancy or sensitization. Other skin patch tests using canvas coated with Aroclor 5460 and an oil modified alkyd resin, in such a manner that the Aroclor concentration in the paint film on the fabric was about 17% by weight of paint solids and the finished coated fabric contained approximately 7% by weight of Aroclor 5460 showed that this painted fabric did not produce a primary irritancy or sensitization of the skin.

If Aroclors are spilled on the skin, the skin should be washed in the usual manner with soap solutions. If accidental burns occur from contact with hot Aroclors, the burn should be treated the same as any ordinary burn. Aroclor adhering to the burned area need not be removed immediately unless treatment of the burn demands it, in which case use soap and water or repeated washings with a vegetable oil.

END USES FOR AROCLOR COMPOUNDS

INDEX

FOR SALESMEN'S USE ONLY

END USES FOR AROCLOR COMPOUNDS

GENERAL

You remember some time ago you cooperated with us in supplying information about where your customers are using Aroclor compounds and the reasons why they were using them. This survey covered all accounts that purchased over 5,000 pounds of Aroclor annually. Your aid in this project was deeply appreciated. We have now compiled these results and this is the way it stacks up. We hope this will be useful to you in suggesting new uses or applications for the Aroclors and increasing your sales of these products.

SURFACE COATINGS are the largest single outlet for the Aroclor compounds. The adhesion, cost, chemical resistance, and flame resistance of these Aroclors are of tremendous importance.

The ADHESIVES Industry also consumes large quantities of Aroclors. In the adhesive field the adhesion, cost, and flame retardancy are the three most commonly mentioned reasons for the use of these products.

The PLASTICS Industry also consumes sizeable quantities of Aroclors depending upon the type of end application. The reasons most commonly mentioned for using the Aroclors are adhesion, cost, flame retardancy.

The miscellaneous category includes all types of applications, some of which are large, some of which are very small. However, we have outlined these applications in the attached sheets.

The attached write-ups are for your own use only, and not to be shown to customers. You will note we have shown four categories in order to give you an idea of our volume in each field. The break down on these is shown below.

Large	500,000 pounds and over
Good	250,000 - 500,000 pounds annually
Fair	100,000 - 250,000 pounds annually
Minor	Less than 100,000 pounds annually

You will note a practical potential figure. This is an indication of the number of times we could probably expand our participation in this field with effort.

We have shown products used. These are in descending order of use in the field of application.

We have shown the number of customers for each particular application and the number of bulk and truckload customers to give you a better understanding of the field; as well as the number of times a reason for using the Aroclors appeared in this particular field.

In addition to giving you a summary page on the entire field, we are backing this up with a list of patents that have appeared in each field and slants from your call reports. We hope this will aid you greatly in getting a better understanding of the Aroclor field, plus aiding you in your sell-more Aroclor program.

CHLORINATED RUBBER

Chlorinated rubber (Parlon) is used in many fields of applications. Of the thirty-one accounts, we find that chemical resistance coatings, and masonry paints are the two most common uses. However, traffic paints, marine type paints, and shingle coatings also get a good play in this field.

A FLAME-RESISTANT, WATERPROOFING impregnating compound for asbestos cloth used in locomotive cabs contains chlorinated rubber, an Aroclor compound, and a wax. U.S.P. 2,145,235 by Robert E. Cryor assigned to Union Asbestos and Rubber Company, Chicago, Illinois.

Liquid Aroclor Compounds plus chlorinated rubber and pigments are used in a coating to protect and COLOR CONCRETE. U.S.P. 2,306,570 by Edward W. Scripture Jr., Skaker Heights, Ohio.

NITROCELLULOSE COATINGS

We find that our Aroclor compounds are being sold in Nitrocellulose lacquers for the following applications.

1. Electrical Appliance cable finish for dielectric properties of the finished cable.
2. Heel lacquers for women's shoes.
3. Lacquers for fiber seat covers for automobiles.
4. Overprint varnishes.
5. Wire cable coatings.
6. Metallic lacquers.

While Nitrocellulose is an old product, there are constantly new applications for the use of Aroclors popping up in this field.

POLYVINYL CHLORIDE

In totaling up the amount of Aroclors sold in polyvinyl chloride surface coatings, we were surprised to find that it was so large. Among the interesting applications are flame proof acoustical tile finishes and metal coatings where the Aroclor contributes adhesion.

A COATING FOR BARRELS and similar metallic surfaces composed of a vinyl chloride/vinyl acetate copolymer, an Aroclor compound, plasticizer and pigments. U.S.P. 2,111,395 by Otto J. Hartwick assigned to Pittsburgh Plate Glass Company, a corporation of Pennsylvania.

A METAL COATING that can be later pressed and formed has a finish lacquer over it for chemical resistance composed of polyvinyl chloride and an Aroclor compound dissolved in suitable solvents. U.S.P. 2,293,420 by Geory Wick, seized by Alien Property Custodian.

AN ELECTRICAL INSULATING MATERIAL for exposed bus bars comprised of a vinyl chloride/vinyl acetate copolymer, Tricresyl Phosphate, an Aroclor compound, and stabilizer. U.S.P. 2,183,811 by Edward C. Homan assigned to Irvington Varnish and Insulator Company, Irvington, New Jersey.

AN IMPREGNATING AND INSULATING MATERIAL for filling interstices for embedding or covering objects is composed of a small amount of polyvinyl-carbozole and a large amount of an Aroclor compound. U.S.P. 2,227,637 by Rudolf Engelhardt assigned to I. G. Farbenindustrie Aktiengesellschoft, Frankfort-on-the-Main, Germany.

A METAL COATING composition capable of being bent after baking is composed of a vinyl chloride/vinyl acetate copolymer and an Aroclor compound dissolved in suitable solvents. U.S.P. 2,115,214 by Clifford Jay Rolle-assigned to Ault and Wiborg Corporation, New York, New York.

STYRENE-BUTADIENE

In Styrene Butadiene coatings, which are commonly used in masonry paints, and metal paints we find one unique characteristic of the Aroclor compounds is their improved anti-tarnish characteristic compared to Chlorinated Paraffins when metallic pigments are used.

RANDY GRAHAM reports the reason they switched from Chlorowax to Aroclors 1254 and 5460 in their Pliolite S-5 traffic paint was because Chlorowax 70 precipitated from the formulation. When the paint was applied the precipi-tated Chlorowax was pressed out of the film and it affected the drying time. He talked with Goodyear about this problem and they ran a series of tests. Their findings verified test results which he had obtained where precipitation of Chlorowax took place. He said Goodyear's new technical bulletin will probably call for Aroclors in Pliolite formulations for traffic paints.

EPOXY RESINS

As you know, we have a big push on for the use of Aroclor compounds in epoxy plastics and surface coatings. Shown below are three references which may be of value to you.

JOE HENNINGER contacted Mr. _____ to follow up his purchase of 300 pounds of Aroclor 5460 in late November. This material is being used in epoxy resin coatings. Mr. _____ said that he very much approves of the flaked material over the old Aroclor 5460 which he had previously evaluated.

ED FORDING reports a customer using Aroclor 1254 in self-extinguishing epoxy coatings. The Aroclor 1254 produces an excellent gloss with a great depth.

They are currently using Aroclor and Mod Epox in an epoxy terrazzo. JOHN ELWOOD says that this is a relatively new product with them and seems to be going over very well. They expect their purchases to increase greatly in 1961.

POLYVINYL ACETATE

In polyvinyl acetate coatings the Aroclor compounds are used primarily in concrete or stucco paints plus one account that is using them in a paper coating.

ASPHALT COATINGS

In the asphalt coating field the Aroclor surface coatings are used primarily to impart flame retardancy and good corrosion resistance

F

JOHN LONSBERG has an account that uses Aroclor 1254 in conn coatings on pipes, underground and above ground.

PHENOLIC SURFACE COATINGS

Phenolic surface coatings seem to find their greatest play in masonry and marine coatings.

JIM COMPTON reports that a p-tert-amyl phenolic type marine varnish containing 40 parts of Aroclor 1268 showed up very well in exposure tests of fourteen months at 45° angle in Florida. The Aroclor 1268 is used to give a velvet-like appearance to low-gloss varnish, probably by recrystallization of Aroclor as varnish dries. Varnish is 50% solids with 50 parts mineral spirits, 50 parts turpentine, 50 parts Celite 110, 6 parts Bentone, 40 parts Micromica (C-300 English Mica Company) and 3 parts anti-skinning agent. Also used is Cobalt drying agent and zirconium dry catalyst. Expected use is a varnish for cedar or redwood.

ALKYDS

JOHN ELWOOD has an account that uses Aroclor 1254 and 5460 in an alkyd in combination with a wax for the flame proofing of Christmas Trees.

The use of Aroclor compounds increases the adhesion of SHORT OIL varnishes. National Paint, Varnish, and Lacquer Association. Science Section Circular #555, 100-103 (1938)

MISCELLANEOUS

In looking over the miscellaneous category, which is too minor to report, we find that Aroclors are being used in both ETHYLCELLULOSE and CELLULOSE ACETATE BUTYRATE for CABLE LACQUERS.

WALLY HILLIARD reports he has a customer using Aroclors in a floor wax in combination with other waxes because of the melting point of the Aroclor 5460.

FRANK GUIGNON reports he has a customer that uses Aroclor 5460 as a sole binder with metallic pigments because of the excellent resistance of the Aroclor compounds with regards to anti-tarnishing properties on the pigments.

The use of Aroclor compounds in ALLYL STARCH emulsions including preparation and hardness is discussed in U.S.D.A. ---- Circular AIC - 351 (1953).

BILL DAMRON has a customer using Aroclor 1254 in a new non-flammable thermoplastic icicle for Christmas Trees.

A WATERPROOFING composition for wood is composed of Aroclor 5460 plus other ingredients dissolved in solvent. The coating drys to a tack-free, easily-painted surface. U.S.P. 2,549,127 by Donald D. Pew assigned to Stopall Waterproofing Manufacturers Inc., Kalamazoo, Michigan

AN ANTI-STATIC coating for plastics is made of acrylic pol Aroclor compound dissolved in suitable solvents. U.S.P. 2,64(Eleanor G. Sheridan, Luther L. Yeager, and John Bjorksten assi Nash-Kelvinator Corporation.

062

JAKE ARBOGAST gave figures on availability of Montars. This is all going into sealing compounds for automotive use.

The technology employed by one of WALLY SCHALK'S accounts was so unlike other aspects requiring plasticizer usage, he was at a loss to recommend plasticizers. Instead, he sent the customer one of our Aroclor booklets. Subsequently, the customer requests samples and informed Wally that the Aroclors imparted some rather unusual and some highly desirable artistic effects to this system.

JOHN LONSBERG has an account that uses Aroclor 4465 in a special floor paint which is mixed with an abrasive to give non-slip properties. The majority of this is for government use at present.

AN AEROPLANE PROPELLER ICE PREVENTING coating composed of polyisobutylene and an Aroclor compound. U.S.P. 2,434,208 by Richard S. Gaugler and Hugh W. Guenther assigned to General Motors Corporation, Dayton, Ohio.

A SEALANT OR COATING for sealing an anodized oxide coating formed on aluminum is made by dissolving 1%-5% of an Aroclor compound in a suitable solvent. U.S.P. 2,698,262 by Frederic Balmar, Versailles, France.

ADHESIVES AND SEALERS

TYPE	VOLUME	PRACTICAL POTENTIAL	AROCLOR PRODUCTS USED	# Customers	# Bulk or TL Customers	Adhesion	Cost	Oxidation	Chem. or Corrosion Resistance	Flame Resistance	Melt Point	Viscosity
POLYVINYL ACETATE EMULSION	Large	2	1232, 1254, 1248, 1221, 1242, 1260	19	7	17	19	1	1	3		5

RUBBER (THIOKOL)	Good	3	1254, 1260, 1221	2	1	-	1	-	-	1	-	1
ASPHALT	Minor	20	Montar, 1254, 5460	3	0	1	1	-	-	-	-	-

OLYVINYL ACETATE EMULSION ADHESIVES

The Aroclor compounds are widely used in emulsion adhesives. If you will remember we used to make Ortho-Nitrobiphenyl. When this product became unavailable, we ran a program to try to replace it with Aroclor compounds. In this we were highly successful. The Aroclor compounds offered the advantage of being liquid, low in color, and easy to mix into the vinyl acetate emulsion. We find customers using them for adhesives, for cartons, envelopes, industrial equipment, and paper board boxes.

POLYVINYL ACETATE HOT MELT

Here is a large field that is growing rather rapidly. This type of hot-melt adhesive is used to bind the quarter paper, back novels, Reader's Digests, etc. It has offered real economies to the publisher because of its rapid set characteristics. The solid Aroclor 5460 is used to make a formulation that is non-tacky at room temperature and is a fluxing aid. The liquid Aroclor plasticizes the composition.

A SEALING COMPOUND for cans to contain alcohols is comprised of a vinyl chloride/vinyl acetate copolymer, an Aroclor compound, Santicizer B-16, and suitable solvents and pigments. U.S.P. 2,392,412 by John E. Robinson and Paul W. Millilot, Jr. assigned to American Can Company.

RUBBER ADHESIVES

We were surprised to find out the amount of Aroclor compounds that are being sold in rubber adhesives. Here the low cost, the adhesion and flame retardancy of the Aroclor is of prime importance. With regards to end applications, we find that Aroclors are being used in rubber adhesives for rug backings, flooring adhesives, and tape mastics. In addition, one company is making an emulsion adhesive based upon polyisobutylene and Aroclor.

RUBBER (THIOKOL)

Here is another sleeper. The quantity that we are moving in this field once again caught us by surprise. Evidently, the Aroclor compounds are one of the few materials that give high compatibility and flame retardancy with the Thiokol material. The primary end use is in sealing compounds for aluminum windows, industrial applications, curtain wall construction, etc. The normal range of application will be anywhere from 10 parts of Aroclor up to 50 parts of Aroclor.

FRANK GUIGNON has a customer currently working on a polysulfide synthetic rubber development. The end product will contain about 50% Aroclor 1221. The finished product is to be used for flexible molds, electronic potting, and building sealants. Aroclor functions as a plasticizer in the formulation.

MISCELLANEOUS

The Aroclor compounds are used in a variety of miscellaneous adhesive applications. The following references may prove valuable talking points at specific accounts.

A SEALING COMPOUND for the joints of conduits and contains effective form -67°F to 212°F is made by mixing approximately equal parts of amorphous graphite and an Aroclor compound. U.S.P. 2,471,010 by Laurence L. Rector, Fort Worth; and Charles L. Cron, Houston, Texas.

A SEALING AND ANTI SEIZE pipe joint compound is made of powdered graphite, an Aroclor compound, and a small amount of solvent. U.S.P. 2,508,596 by Clarence H. Cox, Clayton, Missouri.

A BOOKBINDING hot-melt adhesive composed of a viscous linear polyamide resin and an Aroclor compound (40%-65% chlorine). U.S.P. 2,612,463 by Rodney G. Brown assigned to E.I. DuPont de Nemours and Company, Wilmington, Delaware.

LEATHER and SHOE heat activated adhesive composed of Butadiene-Acrylonitril rubber copolymer, basic zinc carbonate, a vinyl chloride/vinyl acetate copolymer, and a solid Aroclor compound dissolved in a suitable solvent. U.S.P. 2,685,572 by John L. Perkins and Edwin E. Sylvester assigned to B. B. Chemical Company, Boston, Massachusetts.

METAL FOIL adhesives that can be applied hot or cold comprised of 25% of a liquid Aroclor compound, 50% of a solid Aroclor compound and 25% of a para coumarone-indene resin. U.S.P. 2,096,110 by Harry Kittredge and Sylvester J. Broderick assigned to Foilfilm Inc., Dayton, Ohio.

A HEAT ACTIVATED adhesive showing resistance to cold flow composed of approximately 100 parts of paraffin wax, 96 parts of Aroclor 5460, 45 parts of coumarone resin, and other ingredients. U.S.P. 2,376,778 by Ernest L. Kallonder assigned to Dennison Manufacturing Company, Framingham, Mass.

PUTTY made with the Aroclor compounds are non-hygroscopic, flame resistant, have excellent adhesion and remain flexible, soft and usable indefinitely. U.S.P. 2,743,188 by Samuel N. Hunter assigned to Hunter Metallic Products Corporation, East St. Louis, Illinois.

JOHN OREM reports that Jack has evaluated many plasticizers and finds Aroclor 1254 to be about the best with the epoxy systems. He has formulated a soft epoxy plasticized with about 30% of Aroclor 1254. Its use would be for a socket sealer. The epoxy cures at 350°F in one hour with an amine curing agent; will set up at room temperature in two days. Jack finds this formulation very stable in the presence of high heat of about 350°.

A thermosetting OPTICAL cement composed of dialkyl phenyl phosphonate and a viscous liquid Aroclor compound. U.S.P. 2,678,586 by John J. Lugert assigned to Eastman Kodak Company, Rochester, New York.

POLYSTYRENE WALL TILE EMULSION ADHESIVE composed of polystyrene emulsion, clay, Aroclor compounds, and other ingredients. The resultant adhesive has excellent adhesive characteristics and is waterproof. U.S.P. 2,486,756 by John F. Murphy and Russell Omadahl assigned to Monsanto Chemical Company, St. Louis, Missouri

PLASTIC APPLICATIONS

TYPE	VOLUME	PRACTICAL POTENTIAL	AROCLOR PRODUCTS USED	# Customers	# Bulk or TL Customers	Adhesion	Cost	Flame Resistance	Extraction	Chem. or Corrosion Resistance	Viscosity

CHLORINATED RUBBER	Minor	5	1232, 1254	1	0	-	-	-	-	-	-

PLASTIC APPLICATIONS

The low cost flame resistance and adhesion characteristics of the Aroclor compounds were most commonly mentioned in the plastic applications.

EPOXIES

Once again we are pleasantly surprised to find the volume of Aroclor that was moving in epoxy resin applications. Specific details on how these products were being used and the type of end applications were not available. The plasticization and the flame retardancy plus chemical resistance were the three most important reasons.

One of NORM JOHNSON'S accounts is planning to manufacture a coil from a flame retardant epoxy formulation utilizing Aroclor 1260. This flame retardant epoxy formulation has passed their customer's requirements in initial testing.

BILL DAMRON reports the customer is using Aroclor 1254 in a self-extinguishing laminated phenolic and epoxy application for printed circuit work.

POLYVINYL CHLORIDE

In the PVC plastisol field and in the compound field we find sizable volumes of Aroclors being used. The solid Aroclors are used in compounding primarily for processability while the liquid Aroclors are used in plastisols for viscosity stability and flame resistance. Also, in plastisols the solid Aroclors are used because of their low volatility and excellent adhesion.

Vinyl resins modified with Aroclor compounds are usable in making molds for thermosetting resins. U.S.P. 2,525,177 by William Lockwood assigned to Calresin Corporation of Culver City, California.

CURT SINGLETON passed along one of Bill Grosse's tip items. The tip of using 40 PHR of Aroclor 1268 was successful in a problem they have had wherein a prospect wanted a plastisol for dipping gloves but wanted a velvet feel to the coating.

Aroclors are used in foamed plastisols to control the blowing of the foam and in glove dipping to impart chemical resistance.

PHENOLIC MOLDING

In phenolic molding the Aroclor compounds are utilized as flow aids in grinding wheels and in brake linings.

CELLULOSE ACETATE BUTYRATE

In cellulose acetate butyrate the Aroclors are commonly used in hot melt applications. Here we would recommend adequate ventilation, of course. The solid Aroclor melts at the dipping temperature, but does not cause excessive tackiness when the part is cooled.

A HOT MELT coating comprised of high butyryl cellulose esters and Aroclor compounds. U.S.P. 2,481,687 by Martin Salo and Harold F. Vivian assigned to Eastman Kodak Company, Rochester, New York.

A TRANSLUCENT PAPER BASE is made by impregnating the paper with a hot melt containing a high percentage of an Aroclor compound plus resin and overcoating with plasticized hot melt. U.S.P. 2,635,970 by Martin Salo and Harold F. Vivian assigned to Eastman Kodak Company, Rochester, New York.

MISCELLANEOUS COMPOUNDS

Of course, the Aroclor compounds are widely used in a lot of miscellaneous resins. Some of these applications involve only one or two customers of rather insignificant nature. However, we thought the following references might be of interest to you.

POLYVINYL BUTYRAL resins modified with Montars show good heat and humidity stability. U.S.P. 2,506,014 by Francis J. Curtis assigned to Monsanto Chemical Company, St. Louis, Missouri.

POLYSTYRENE molding products made non inflammable with a solid Aroclor compound possesses good electrical properties. U.S.P. 2,454,255 by Joseph R. Mores assigned to Monsanto Chemical Company, St. Louis, Missouri.

A FUNGICIDAL HOT MELT INSULATING compound composed of resins, an Aroclor compound, a fungicide and other materials. U.S.P. 2,556,451 by Howard E. Smith assigned to Insul-X Corporation, Brooklyn, New York.

BILL MADDOX reports that Aroclor 1268 is, apparently, doing quite a job thus far---used as a flame retardant in their silicone rubbers.

A customer of LEE JOHNSON is using regularly a combination of Aroclor 1254 and Aroclor 1268 in asphalt as a flame retardant. The combination of Aroclor and asphlat is eventually coated onto paper.

Aroclor compounds are used in the colloid layer of PRINTING FORMS U.S.P. 2,291,673 by Fritz Albers and Edward Schloemann assigned to General Analine and Film Corporation.

A HOT MELT coating for webs of paper or textiles composed of polyethylene, terpene resins, an Aroclor compound, and paraffin. U.S.P. 2,453,644 by Walter C. Steinkraus, Chicago, Illinois.

One of BILL DAMRON'S customers said Aroclor 1254 was used because of its fire resistance into resin material products. They are using it in two applications: wax paper coatings for paper converters and manufacturing liquid wax compounds for treating electrical component parts.

A RUBBER composition with good mechanical properties and improved fire resistant properties is made by adding 20 parts of chlorinated rubber to 80 parts of Aroclor 1260. Heat until the rubber is dissolved. Cool and add to 100 parts of rubber plus fillers and curing agents. U.S.P. 2,143,470 by Wilhelm Becker and Albert Kock assigned to I.G. Farbenindustrie Atkiengesellschaft, Frankfort-on-the-Main, Germany.

A HEAT RESISTANT INSULATION compound composed of rubber and Aroclor compounds show good properties. U.S.P. 2,416,955 by Samuel J. Rosch assigned to Anaconda Wire and Cable Company, a corporation of Delaware.

Aroclor compounds are used to plasticize POLY p XYLENE compounds and filaments. U.S.P. 2,763,630 by James K. Hubbard assigned to E.I. DuPont de Nemours and Company, Wilmington, Delaware.

Aroclor 1260 is used in a low flammable, STERILIZABLE HAIR BRUSH made from Ethylcellulose. U.S.P. 2,326,811 by David R. Wiggam and William Koch assigned to Hercules Powder Company, Wilmington, Delaware.

The miscellaneous applications for Aroclor cover a wide variety of applications.

HOT MELT WIRE COATINGS

In this application the market, while huge, is limited to a few companies that seem to control the bulk of the business. Here the Aroclors are blended with wax and phosphate esters to make hot melts that are then used to flame-proof cables. Unfortunately as vinyls increase in volume in the electrical trade, the application for Aroclors as an impregnant decrease.

CARBONLESS CARBON PAPER

This is an application that is patented. However, we have many other requests for Aroclors in carbon paper applications, some of which seem to be showing a fair deal of success.

CASTING WAX

The investment casting field is one that has been reborn. It is sometimes called the "lost wax" technique. We have made a sizable survey and you will be hearing more about this later. As it now stands, however, you can see we have a good many customers and the current volume is good. The flame resistance, the high impact strength, short melting point, and other desirable characteristics imparted by the Aroclors will enable us to give you a full story as soon as we are able to contact a few more people and verify their requirements.

AN ELECTRICAL INSULATING material is made by impregnating the base material with a mixture of styrene monomer and an Aroclor compound followed by polymerization. U.S.P. 2,147,824 by John Krauss Webb assigned to International Standard Electric Corporation of New York, New York.

CLOTH IMPREGNANT

Aroclors are used to impregnate felts for the Navy, for sound deadening characteristics in ships; they are also blended with wax to impregnate asbestos cloth to impart electrical properties. Other applications for Aroclors as impregnants are as follows:

SILICA TEXTILE materials that have been leached and then coated with a solution of Aroclor 5442 show improved abrasion resistance. U.S.P. 2,686,954 by Leon Parker assigned to the H.I. Thompson Company, Los Angeles, California.

RANDY GRAHAM has a customer currently using a mixture of Aroclor 5460 and Aroclor 1254 as an impregnant for welding cloths which are used in fabrication plants. He said that he actually flame proofs these cloths so that when sparks from welding hits the cloth no holes are burnt through. He is currently selling this to a steel company for their welding rooms which use these canvas cloths as walls to cut down on the amount of flying molten metal which occurs when welding. It might be that it could be extended to pup tents and the tent industry and maybe added in combination with some waterproofing chemical.

GEORGE STEWART recommended the use of Montars to a customer who felt some of the air-conditioning companies such as Carrier plan to specify FIRE-RESISTANT ASPHALT FELT in 1961 for use in all air conditioning equipment.

A composition to give good resistance to both flame propagation and after flow is made by a combination of Aroclor compounds plus aldehyde condensation resins. U.S.P. 2,461,538 by Earl K. Fisher assigned to Interchemical Corporation, New York, New York.

A flameproofing composition is based on a mixture of a thermally unstable chlorinated resinous material, zinc carbonate, and other ingredients plasticized with a flameproofing plasticizer such as an Aroclor compound. U.S.P. 2,378,714 and U.S.P. 2,326,233 to Martin Leatherman, Hyattsville, Maryland.

INSECTICIDE CARRIERS

There has been a number of government articles which appeared on the use of Aroclors to extend the life of volatile insecticides for non-food prompt uses. Shown below are a series of references which may be of interest to your insecticide potentials:

Chlorinated Polyphenyls to improve Lindane Residues. W. N. Sullivan and I. Hornstein in Journal of Economic Entomology Volume 46, February 1953, Pages 158-159.

Improving Deposits for controlling insects outdoors. W. N. Sullivan, Irwin Hornstein, A. H. Yeomans, and Ching-Hsi Tsao, Journal of Economic Entomology, Volume 48 No. 2, Pages 153-154.

Aroclor 5460 extends life of Aldrin and Lindane but not DDT. Thought more volatile first two slowly escapes to surface. Thought DDT is marked by Aroclor 5460. Residual Effectiveness of Mixtures of Organic Phosphorous Insecticides with Chlorinated Terphenyls. Irwin Hornstein, William N. Sullivan, and Ching-Hsi Tsao in Journal of Economic Entomology, Volume 48 No. 4, August, 1955, Pages 482-483.

Lowering the Volatility of Lindane Cuttle Sprays by Addition of Film Forming Material. Irwin Hornstein, W. S. McGregor, and W. N. Sullivan in Agriculture and Food Chemistry, Volume 4, No. 2, February 1956, Pages 148-149.

The Use of Chlorinated Polyphenyls to Increase the Effective Insecticide Life of Lindane. Edward J. Duda - Journal of Entomology Soc, 218-219, (April 1957). Aroclor 5460 and Lindane may exhibit a synergystic effect in controlling elm leaf beetle.

PRINTING INKS

How many times have all of us thought that more Aroclors should be used in printing inks. At the present time a rather small amount is consumed in this field. Although as the following references show, there is considerable interest:

PRINTING INKS for metal application are prepared by dispersing pigments in EPOXY resins and Aroclor compounds. The inks show no discoloration upon baking and provide a smooth strong film. U.S.P. 2,736,719 by Hugo

P. Stockmayer assigned to Sun Chemical Corporation, Long Island, New York.

A WET FINISHING varnish composed of an alkyd resin in solvent modified with a liquid Aroclor compound and polymethyl silicone. U.S.P. 2,736,355 by Jerome A. Ryan assigned to the The Sherwin Williams Company, Cleveland Ohio.

For Dick Tracy fans, JIM COMPTON has a customer currently using Aroclor 1221 at about a 1% level in an invisible ink formulation used to trace cutting pattern on Chenille rugs and spreads. Recently had to switch dye ingredients and Aroclor 1221 would not work with new dye, but Aroclor 1262 did work.

PIGMENT GRINDING AND CARRYING

This is a natural application for the Aroclor compounds. The customer by his choice of Aroclor can develop the type of viscosity he desires. The Aroclors give rapid wetting action into most pigments.

BILL MORLOCK has an interesting application where the customer is dispersing pigment and catalyst in Aroclor for polyester applications.

Aroclor 5460 is an excellent "wax" for DISPERSING PIGMENTS in solvents. U.S.P. 2,772,982 by Vincent C. Vesce assigned to B. F. Goodrich Company, New York, New York.

Aroclors are excellent wetting agents for the preparation of METALLIC PASTE PIGMENTS. U.S.P. 2,713,006 by Samual N. Hunter assigned to Hunter Metallic Pigments, East St. Louis, Illinois.

MISCELLANEOUS

The Aroclors also find a lot of miscellaneous applications, some of which are discussed briefly below:

Solid powdered Aroclor compounds are used as a DELUSTERING AGENT for rayon. U.S.P. 2,111,449 by James W. Humphrey and John W. Pedlow assigned to American Viscose Corporation

This company using Aroclor 1248 to thicken ceramic slurry reports JOHN ELWOOD.

RAY GREENE reports a metals laboratory has a rather unique use of Aroclor 1268. It is melted and then used to fill the pores of nickel sponge. The sponge can then be machined without destroying the cell structure. After it has been fabricated, it is brought to a high temperature and the Aroclor is probably vaporized off.

A WATER SOLUBLE SOIL-POISON concentrate is made by blending an Aroclor compound, trichlorobenzene, pentachlorophenol, isopropyl alcohol, and other materials. U.S.P. 2,588,318 by Paul G. Benignus assigned to Monsanto Chemical Company, St. Louis, Missouri.

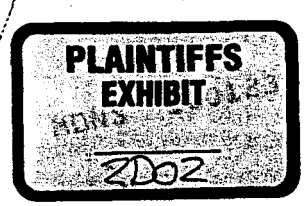
Attached is a list of questions and answers which may be asked of you by customers receiving our Aroclor-PCB letter. You can give verbal answers; no answers should be given in writing. If the customer asks a question you can't answer or if he wants an answer in writing, then send his questions to me and we will answer from here.

We want to avoid any situation where a customer wants to return fluid. The new reformulated products will be available within a month. We would prefer that the customer use up his current inventory and purchase Pydraul 625A, Pydraul ACA, Pydraul ACA Winter Grade and Pydraul 540A when available. He will then top off with the new fluid and eventually all Aroclor 1254 and Aroclor 1260 will be out of his system. We don't want to take fluid back. Sell him the replacement.

We must be very positive in our approach with each customer relative to our decision to eliminate the use of Aroclor 1254 and Aroclor 1260 in our Pydraul products. We (your customer and Monsanto) are not interested in using a product which may present a problem to our environment. We certainly have no reason to be defensive or apologetic about making this change. The decision to change makes good sense and our customers should commend us, not criticize our actions. No one has forced us to make this



IH-18 REV. 11 69

change. We have done it to keep our customers out of possible trouble. They should appreciate our effort, and stay with us as a customer on the reformulated Pydrauls. To make this change has cost us research monies and time. Fortunately, we possess the technical skills to make a change in our formulations without affecting the performance of products. Be positive, Take the offense. Don't let a customer or competitor intimidate you. I doubt if our competitors know whether their product could present a problem to our environment. You might ask your customer, if he has ever asked Houghton or Stauffer, Carbine, etc. about the effects of their products.

We should also recognize (point this out to your customer) we must clean-up. The Chemical Week article gives him an idea of laws in effect in his state. Read this yourself. Be familiar with the data on each state in which your customers are located. Use this in your discussions.

We have no replacement products for Aroclor 1254 and Aroclor 1260. We will continue to make these products; however, customers will have to use their own judgement on continued use.

We can't afford to lose one dollar of business. Our attitude in discussing this subject with our customer will be the deciding factor in our success or failure in retaining all our present business. Good luck.

(We have also attached a copy of the letter sent to transformer customers.)

We have been in communication with a Dr. Hill of the Ohio State Board of Health. He has found PCB, particularly Aroclor 1254, in samples of milk from at least three herds in Ohio. He has traced this contamination back to silage from three different silos. Dr. Hill reported concentrations of 0.2 ppm of PCB in the silage in the center of the silo and up to 20 ppm in the material next to the walls. He also stated that concentrations in the milk were between 0.1 ppm and 0.6 ppm and that some of the milk had been destroyed.

The silos are concrete silos whose interior surfaces were painted in 1967 using a formulation that contained 1254. I don't know if there was any other Aroclor in the formulation nor do we know the coating manufacturer; although, this could be found out if important. The presence of PCB in the silage came from flaking off of the material and possibly from leaching out during the silage storage. At present they will have to destroy about 150 tons of silage which is valued at about $30 per ton. As a rough guess, they consider there may be 50 other silos involved in Ohio that were painted with the same formulation. They are also looking into the fat contamination of the cows themselves.

All in all, this could be quite a serious problem, having legal and publicity overtones.

This brings us to a very serious point. When are we going to tell our customers not to use any Aroclor in any paint formulation that contacts food, feed, or water for animals or humans? I think it is very important that this be done. It may be that some of the customers will assure themselves on the basis of non-extractability that a particular formulation might be safe but I think we should make a blanket recommendation against these uses.

Mr. D. Hood
~~London~~ Brussels

We have had a rather extensive meeting, which included the St. Louis individuals receiving copies of this memorandum, on Aroclor in the air and in various fish and other living reservoirs.

The decision was that more information had to be gained, and whether this would necessitate a trip from someone in the Medical Department to the various agencies working on this problem in Europe would depend upon how easily obtainable these gaps in our knowledge are by other means than personal communication.

We are very worried about what is liable to happen in the states when the various technical and lay news media pick up the subject. This is especially critical at this time because air pollution is getting a tremendous amount of publicity in the United States.

We have been receiving quite a few communications from our customers, but the most critical one is NCR, who are very much involved with their carbonless carbon paper.

I have listed a number of points referring to information I would like to have. Some of these may be easy to answer; others might take a little bit of investigation and some might not be feasible to answer at this time. However, please let me know your ideas on each one of the following items:

1. Can we get the original articles in the Swedish press, including Dagens Nyheter? I have a good fluent Dane who translates Swedish very well and is a physician and investigator, so nothing will be lost in the translation.

2. Who were the participants in the conference referred to in your memorandum to Mr. Buchanan of January 26? Under whose auspices was it held and were there any reports issued? What were the conclusions of the conference and was any action decided upon?

MONS 031358

3. What was the medical institute in Sweden that was going to do the toxicological work referred to in the same memorandum to Mr. Buchanan? Who was going to pay for it and what was the scope of the investigation?

4. In LKB press release of January 10, they stated that 12 OECD nations were going to do work on this problem. Can anything be found out about the extent of this work? Who is doing it, and at what institutes?

5. What is known about the work in England at the Monks Wood Experimental Station and the Laboratory of Chemistry in London? How long has this gone on? Is it an ongoing study? What are the perimeters of the study?

6. Do we have the complete paper in Swedish of Jensen and Widmark entitled "Pesticide Analysis--Presence of Polychlorinated Biphenyls and Residual Analysis of Biological Samples"? This was referred to in D.V.M. Hardy's letter of January 12, 1967. I would like to get this original paper with the bibliography in Swedish.

7. Can I have more information about the Carlin Institute of Toxicology which was referred to in Mr. Widmark's letter to Mr. Ford of December 29, 1966? What do they intend to do? Who is the contact, and is it located in Stockholm?

By copy of this memorandum, I am asking Dr. Hardy to find out what the situation is in the two English contacts referred to in item 5.

The consensus in St. Louis is that while Monsanto would like to keep in the background in this problem, we don't see how we will be able to in the United States. We feel our customers, especially BCR, may ask us for some sort of data concerning the safety of these residues in humans. This obviously might be opening the door to an extensive and quite expensive toxicological/pharmacological investigation. Before starting this, we certainly want to find out what is going on and not duplicate any of the work. I have tried to call you for the last two days and I will be out of town next week, but I would like to call you the week of the 20th. Perhaps by then you might have some answers to some of the questions.

R. Emmet Kelly, M. D.

REK/ln

MONS 031359

1. PCB-A NEW FISHDEATH?

2. Picture: The young salmons die in the salmons station at Älvkarleö. The Fish Pathologist, Mr. N. Johansson suspects that this is caused by PCB. A loophole in the law prevents the Authorities to take any action.

3. We have got a new environmental poison - PCB. On July 26th Småland and Östergötland (counties in Sweden) were hit by a soot and oil rain. Analysis shoe that such a rain contains among other things PCB. PCB is rather like DDT, but probably more poisonous. By eating PCB-poisoned rise-oil many people in Japan have died. In Sweden "Folhälsan" have found PCB in almost all the fish and meat they have analysed.
From 1968 to 1969 the PCB-content in analysed samples increased by 50 %. Last year 80-100% of roe and young salmons died at the Salmon Research Institute at Älvkarleö. The fishes had high PCB-content. PCB is very stable. It cannot be destroyed by living organisms and is spread in nature in higher and higher concentrations. PCB is found in fishes, birds and people all over the world.
PCB is used as cooling-oil and insulating fluid in high tension transformers and as plsticizer and alga-killer in paint and sealing compounds. Because of a loophole in the law the use of PCB cannot be stopped.

4. Investigations show that soot and oil rains of the kind that hit the coast of Småland and Östergötland on Sunday contain PCB. PCB is a environmental poison that slowly steal upon us. It cannot be destroyed by living organisms. PCB is sold without limitations. A loophole in the law prevents the Authorities from doing anything against the use of it.

MONS 031360

5. Life-dangerous environmental poison, new DDT-threat.

6. In roe and young salmons at the Salmon Research Institute in Älvkarleö the percentage of death usually is about 10-29%. High content of PCB (polychloribated biphenyls) has been found in the roe. In Sweden "Folkhälsan" has found PCB in almost all the fish and meat they have analysed. PCB is rather like DDT but perhaps it is more poisonous that DDT. "Naturvårdsverket" has done a first review of the use in Sweden. It has been classified as strictly confidential. Because of a loophole in the law neither "Naturvårdsverket" nor "Giftnämden" can stop the use of PCB. PCB is an environmental poison which slowley but surely steals upon us. The content is closed to, is on a level with, or is above the content of DDT. The use of PCB is free. What is PCB?
It is a group of chridizing hydrocarbons, a group of clorinated biphenyls tightly tied together in a syntetic way. This is manufactured by having chlor to react with biphenyl, on aromatic hydrocarbons.

In Sweden they sell three products: The Frenchmade Pydralén, the American Aroclor and the German Clophen. The most common kind here in Sweden is Clophen which is manufactured by Bayerische Anilin in Leverkusen. Two fields of application dominate: as cooling-oil and insulation-fluid in high tension transformers and condensors and as plasticizers and alga-killers in paint - and sealing compounds.

All over the world:
It seems strange that the leakage from these rather special fields of application can be the reason for nos finding PCB in fish, birds and peolple all over the world. But PCB cannot - as far as they know - be destroyed by living organisms. If it gets in us or in nature it will circulate while the quantities increase.
A practical thing in a few technical situations becomes a grewing environmental danger.
Assistant Prof. S. Odén at "Lantbrukshögskolan" "takes finger prints" of the cities in Sweden from the environmental poison point of view by researching the content of poison in sludge of the cleaning plants. They looked for PCB in 63 cleaning plants and found it in all of them. The content was highest in the industrial areas. The content has increased with ca 50% between the tests in 1968 and 1969. Mr. Odén says that htere is no other reason for this than that PCB has been used more and more.
"Naturvårdsverket" has no right to demand the PCB-consumers to put their cards on the table.

The customer list tells:
Manager General V. Paulsson says: "Against promise of secrecy we succeeded in taking part of the Swedish PCB-sellers' customer list. I am afraid we are not allowed to publish this material".
"Naturvårdsverket" asked Ing. A. Kjällman to visit the companies which use PCB. We wrote to about 20 paint companies and electrical industries and visites some of them.
This is the quantity used in Sweden every year: 500 tons in condensors and transformers, 55 tons in PVC - and rubber paint, 15 tons in shipbottom paint, 35 tons in sealing compounds.
-"At some companies they throw it in a dump, at other places they throw it in the waste-water," Ing. Kjällman says.You notice PCB in paint, when you wash dishes and when you scrape boats.
PCB is undestroyable through burning. It cannot be disolved even if you boil it in concentrated Nitric Acid.
The transformers leak:
In electrical works they use it in a closed system. No oil or cooling fluid will leak out. When they change the oil they return the old oil to the manufacturer. But sometimes there are interuptions of the service in the transformers. "Some time ago we were warned that 3 tons transformer-oil had leaked out into a lake" says Mr. S. Jensen at "Naturvårdsverkets specialanalytiska laboratorium", Uppsala It was mineral oil. But it could as well have been PCB-oil.

MONS 031361

At the Salmon Research Institute in Älvkarleö breeding salmons swim in the water from Dalälven river. Last year they found that a great number of the roe and the young salmons died. Alanysis at "Naturvårdsverket" showed high content of PCB in the progeny.
-"We are very worried about what will happen in the future," N. Johanson says, but we have not enough material yet to be sure it is PCB that kills the salmon progeny. What we know for sure is that the older the salmon female are the higher the PCB-content is in the roe and in the young salmons who die.

Less in wild salmons:
The wild salmons - who give material to the big salmon station - show a much smaller content of PCB. Anyway the death at some stations is as high as 35-40%. Instead of PCB there are high contents of DDT in the progeny of wild salmons, but they have not proved any connection between DDT adn the death of roe.
The environmental keepers who are more prophets than scientists say that it sure will be a day when we know that the salmons die of PCB. What else can you expect when the outleaks are free to continue?
Third part of all the salmons in Östersjön lake come of the stations ashore. To poison the progeny meens the end of salmonfishing. Even if the content in salmon not has to be so high - and today it absolutely is not - that we cannot eat the salmons.
"Folkhälsan" finds high content of PCB in the fishes from almost all the waterstreams they have analysed and even in meat, but the content in metat is lower. In Japan people have died by eating poisoned rise-oil. They know hardly anything about the Toxicological risks for human beings of the content they have now found in Swedish food. The content they have found in Japan is higher than the content here.

Might be serious:
-"The spread of these very stable poisonous materials is not enough analysed from the foodhygiene point of view", Miss G, Westöö "Folkhälsan" says. PCB might become a serious problem.
The lawmakers could never imagine that small shares of chemical and technical products from isdustries leaking out, could stay, circulate in living organisms until they (perhaps) reached highly dangerous concentrations. This is what the President of the Poison Committe, Pharmacist R. Lönngren said when he informed the Govermental Authorities for Environmental Health about this: "PCB belongs to a group of materials with qualities simular to DDT and sometimes worse that that and I think they are a problem we will have reason to analyse more. But there is as far as I know no part of the law that gives any Authority the right to take any action. This is absolutely one of the loop - holes in our law regarding the protection of environmental poisons.

The investigation takes time:
An investigation is working on a law that will stop the loopholes in our law but it will still take time. Meanwhile there is this possibility: The paint companies and the leaders of electrical idustries can take the chance to act in an environmental-kind of way themselves. For example the manufacturer of sealing compunds that leaks out 200-300 kilos PCB in Öresund every year. (Cidfish and plaice in Öresund have very high content of PCB). This also holds for the big paint company in Stockholm which is responsible for the fact that the cleaning plant in Åkeshov (near Stockholm) has to take more PCB than any other cleaning plant in Sweden.

EXHIBIT 19

PCB PRESENTATION

TO

CORPORATE DEVELOPMENT COMMITTEE

I. INTRODUCTION:

We are here today to acquaint you with the PCB (Aroclor) pollution problem and to secure your guidance and approval on a recommended plan of action.

The problem is that Certain PCB's have recently been identified by various scientists along with DDT in fish, birds, and other wildlife.

From the standpoint of reproduction, the PCB's are highly toxic to birds. In a few moments, Elmer Wheeler will describe the problem in detail.

Our objective is to describe for you the basic problems, the issues involved, review alternative courses of action, and suggest an action plan program for your approval.

This is a serious matter, not only from the pollution viewpoint, but also because of the $22 M worldwide customer business involved with resultant gross profits of $10 M and a net investment of approximately $9 M. In addition, there could be possible adverse legal and public relations problems leveled against Monsanto.

Our Agenda will be as follows:

PCB AGENDA REVIEW

I. INTRODUCTION

II. THE PROBLEM

- DEVELOPMENTS INCRIMINATING PCB's
- COMPLEXITY OF IDENTIFICATION
- NATURE OF
- SERIOUSNESS

III. LAW DEPARTMENT VIEWPOINT AND RECOMMENDATIONS

IV. EFFECT ON MONSANTO AND ALTERNATIVES

V. FUNCTIONAL FLUID BUSINESS GROUP DISCUSSION

- MARKETS, USES
- SOURCES OF POLLUTION
- CUSTOMER EFFECT

VI. PLASTICIZER BUSINESS GROUP DISCUSSION

- MARKETS, USES
- SOURCES OF POLLUTION

VII. RECOMMENDED ACTION PLAN

VIII. SUMMARY

By way of introduction, the Organic Division and the Medical Department has been actively engaged for the last 18 months in developing facts and knowledge on this subject by personal visits to Universities and Industrial test laboratories, other worldwide producers, and other industrial collaborators, as well as keeping abreast of all literature and news sources on the subject as well as funding a toxicological and analytical test program in excess of $200 M. We established an Ad Hoc Committee of both Business Groups and Medical which recently issued a report - much of which will be discussed today. We have learned a lot, but there is much yet to learn as you will hear.

What are PCB's? They are polychlorinated biphenyls - better known to us as Aroclors. The next slide will quickly re-familiarize you with our Aroclor business.

MONSANTO WORLDWIDE AROCLOR BUSINESS

POUNDS/YEAR	104 M (70 M in Functional Fluids 34 M in Plasticizers)
SALES/YEAR	$22 M ($16 M in Functional Fluids $ 6 M in Plasticizers)
GROSS PROFIT/YEAR	$10.0 M ($7.5 M in Functional Fluids $2.5 M in Plasticizers)
GROSS INVESTMENT	$13 M ($8.8 M net investment)
ROI	10.5%
WORLDWIDE M/I	62%
MONSANTO PRODUCTION LOCATIONS:	USA (2 plants, Anniston, Alabama Sauget, Illinois)
	UK (Newport)
	JAPAN (Yokkaichi)
OTHER PRODUCERS:	Bayer, Prodelec, Caffaro, Flick, Kanegahuchi, and several Eastern European producers (all ex-USA)

of UK

THE AROCLOR PRODUCT LINE

CHEMICAL NAME	TRADE NAME	NATURE OF MATERIAL
MONOCHLOROBIPHENYL	AROCLOR 1221	THIN LIQUID
DICHLOROBIPHENYL	AROCLOR 1232	↓
TRICHLOROBIPHENYL	AROCLOR 1242	OILY LIQUID
TETRACHLOROBIPHENYL	AROCLOR 1248	↓
PENTACHLOROBIPHENYL	AROCLOR 1254	HEAVY MOLASSES
HEXACHLOROBIPHENYL	AROCLOR 1260	THICK TAR
HEPTACHLOROBIPHENYL	AROCLOR 1262	↓
OCTACHLOROBIPHENYL	AROCLOR 1268	↓
DECACHLOROBIPHENYL	AROCLOR 1270	SOLID
TERPHENYLS	SANTOWAX	↓
CHLORINATED TERPHENYL	AROCLOR 5460	SOLID

MONS 058734

5

There are theoretically 210 different isomers of chlorinated biphenyls.

Monsanto entered the Aroclor market in 1930 by acquiring Swan Chemical Company. The first load of Aroclor went out of Anniston, Alabama to General Electric in 1931. Since then, the market has grown to one of Monsanto's most profitable franchises. This franchise is now being threatened not by competition but by recently found pollution problems which Elmer Wheeler will now discuss.

II. The Problem (Wheeler) - see attached Appendix A

III. Law Department Viewpoint and Recommendations (French)

IV. Effect on Monsanto and Our Alternative Courses of Action

As discussed, Aroclors 1254 and 1260 -- the 5 and 6 Cl ringed biphenyls are the ones most seriously involved in the pollution problem. Both Plasticizers and Fluids Groups are involved as shown:

AROCLOR SALES

(M POUNDS)

	FLUIDS	PLASTICIZERS	TOTAL
AROCLOR 1254	1.45	5.4	6.85
AROCLOR 1260 & ABOVE	3.7	1.7	5.4
	5.15	7.1	12.25

MONS 058736

S

We considered 4 alternative courses of action:

(Slide)

Alternative 1: Do nothing was considered unacceptable from a legal, moral, customer & public relations & company policy viewpoint. This is also the quickest route to being forced out of business.

Alternative 2: Go out of total Aroclor business was considered unacceptable from a Divisional viewpoint, but from a Corporate viewpoint may be necessary. ~~Only you can make that decision.~~ All Aroclor products are not serious pollutants - many degrade; there is too much customer/market need and selfishly too much Monsanto profit to go out. To go out would require a write off of Aroclor net investment of $7 M (10¢/share) or if biphenyl included $8.8 M (12¢/share). In addition, inventory disposition, continuing cost of utilities, and back-up capital and serious manpower & resources reallocation at Anniston.

Alternative 3: Go out of Aroclor 1254 and 1260. This was seriously considered and may eventually occur by our actions and customer actions, nevertheless, we feel that segments of this business are defensible or are so "confined" in use that specific plans of action are called for this portion. Our reasons for eliminating this alternative will become clearer as we outline our action plans.

ALTERNATIVE COURSES OF ACTION

1. DO NOTHING - JUST REACT TO LEGISLATION AND EMOTION.
2. GO OUT OF TOTAL AROCLOR BUSINESS.
3. GO OUT OF AROCLOR 1254 AND 1260 PRODUCTION
4. DEVELOP SPECIFIC ACTION PLANS "TAILORED" TO EACH BUSINESS GROUP AND EACH CUSTOMER/MARKET SITUATION TO "CLEAN UP" THE MESS.

S

Alternative 4: Develop specific action plans tailored to each Business Group and each customer/market situation, - was the alternative selected at this point of time and based on our knowledge from a Divisional viewpoint as making Monsanto act in the most positive, responsible way to society and our customers, as well as our interests.

However, because of the magnitude and seriousness of this problem and its total implications for Corporate Monsanto, ~~the final decision~~ your plan your guidance and approval is needed. on this matter must be ~~made by the CEC~~.

V. Functional Fluids Business Group Discussion:

Aroclors are used widely in 3 of our 4 market areas in the Fluids Group:

FLUIDS USE OF AROCLORS BY MARKET AREA

AROCLOR PRODUCT	DOMESTIC MARKET AREA			TOTAL
	INDUSTRIAL	HEAT TRANSFER	ELECTRICAL	
1242	4.1	1.1	36	41.2
1248	1.2	1.0	-	2.2
1254	-	0.1	0.8	0.9
1260 & Above	0.6	-	3.5	4.1
	5.9	2.2	40.3	48.4

S

SOURCES OF FLUIDS POLLUTION

APPLICATION	INTENSITY OF POLLUTION	
INDUSTRIAL FLUIDS	GREATEST	(DIRECT)
DIELECTRICS	↓	(INDIRECT CONTAINED)
HEAT TRANSFER	↓	(INDIRECT CONTAINED)
PRODUCING PLANTS	LEAST	(DIRECT)

MONS 058741

S

FLUIDS CUSTOMER ALTERNATIVES

AREA OF APPLICATION	PRODUCT OF CHOICE	CUSTOMER OPTIONS
Industrial Fluids	Pydraul 312/F-9/ A-200/Phosphate Esters/ Water Glycol	Customer could get along without us, but Pydraul 312 favored. H_2O Glycol has some pollution problems. Phosphate ester route ok at present.
Transformer	Air/Oil/Aroclor/Gas	Could drop Aroclor at sacrifice of safety, cost or size of equipment or noise level.
Capacitors	Aroclors	No immediate replacement available. Longer term - oil at expense of size and cost of efficiency and redesign of equipment.
Heat Transfer	Therminol	No option for FR liquid market. Other system possibility.
	Oil/Dowtherm/T66 T55 T77 T68	Liquid systems favored. T66 and T55 increasing rapidly in use. Oil also a pollution problem.

MONS 058742

S

Customer Choices & Alternatives & Penalties:

Summarizing, some of our customers have no immediate alternative, some could change only at sacrifices of safety, or cost or various technical factors. Only in the Industrial field could the customer make an immediate conversion.

PCB Threat to Functional Fluids Business and Profit:

FLUIDS BUSINESS THREATENED

(1970 BUDGET)

PROBLEM	SALES	GROSS PROFIT
1. Confined to A-1254/ 1260 only.	$ 3.0 M	$1.36 M
2. Spreads to A-1242 and 1248		
First to: a) Industrial Fluids	$ 4.0 M	$1.6 M
Then to: b) Dielectric Fluids	$ 8.0 M	$3.8 M
Then to: c) Heat Transfer	$ 1.0 M	$ .6 M
	$16.0 M	$7.36 M

— Turn over to Jim Symington

15 +1

VI

PLASTICIZERS
(WORLD-WIDE)

	ALL AROCLORS	AROCLOR 1254/1260 TYPE
1969 SALES, DOLLARS	$ 6.0 M	$1.7 M (28%)
POUNDS	34.0 M	9.5 M (28%)
1969 GROSS PROFIT	$ 2.5 M	$0.8 M (32%)

MONS 058745

COMMENTS: DISTINCTIONS FROM F.P.

1. Large number of direct U.S. customers - 570.
2. Customers are small: 23 direct customers - 47% A-1254/1260 sales.
3. 50% domestic A-1254/1260 sales through distributors - difficult to police.

MARKETS	1968 SALES	MAJOR AROCLOR USED
Carbonless Carbon Paper	8.8 M lb.	Aroclor 1242
Hot Melt Adhesives	5.7 M lb.	Aroclor 5460
Swimming Pool Paints	1.7 M lb.	Aroclor 1254) Aroclor 5460)
Protective Coatings	5.3 M lb.	Aroclor 1254) Aroclor 5460)
Emulsion Adhesives	1.5 M lb.	[illegible] Aroclor 1260)
Sealants	3.0 M lb.	Aroclor 1254) Aroclor [illegible])
Wax Modification	2.0 M lb.	Aroclor [illegible] Aroclor 5460)
Miscellaneous	5.0 M lb.	Aroclor [illegible]) Aroclor 1254)

COMMENTS: 1. [illegible] major customer (85% of Aroclor 1242 sold .

2. [illegible] of domestic Aroclors sold through [illegible] distributors.

MONS 058747

POSSIBLE CONTAMINATION SOURCES

(PLASTICIZERS)

DEGREE OF CONTAMINATION	MARKET	APPLICATION	SOURCE	IS A-1254 /1260 USED?
Most	Coatings	Marine Paints) Water tank linings)	Leaching	Yes
	Coatings	Swimming Pool Paints	Leaching	Yes
	Carbonless Carbon Paper	-	Vaporization	No
	Wax Modification	-	Vaporization	Yes
	Emulsion Adhesives	-	Contact with product via packaging. Incineration.	Yes
	Hot Melt Adhesives	-	Contact with product via packaging. Incineration.	No
Least	Sealants	Automotive Construction Joint sealants	Long-term leaching	Yes

COMMENTS:

1. Unlike fluids, Aroclor plasticizers are combined into plastics to produce the final product - therefore, far less mobile.
2. Problems such as wastes from our manufacturing plants, customers plants and and leasing of drums common to both groups.
3. Exterior protective coatings are not considered a high potential source.
4. Vaporization of Aroclors during plant processing or [illegible] products. Rain will wash vapors back to earth.

MONS 058748

PLASTICIZER BUSINESS THREATENED

PROBLEM	SALES RETAINED*	$ G.P. RETAINED (LOST)
1. Confined to A-1254/1260 type only.	$4.3 M	$1.7 M (-$0.8 M)
2. Spreads to all chlorinated biphenyls.	$2.0	$0.6 M (-$1.9 M)
3. Spreads to all PCB's and all chlorinated terphenyls	0.0	0.0 (-$2.5 M)

*Based on 1985 prospects.

COMMENTS: Plasticizers sell Aroclor 1262/4465 which are very close to A-1254/1260 and these have been included as A-1254/1260.

MONS 058749

RECOMMENDED ACTION PLAN

THE JOINT ACTION PLAN DEVELOPED BY THE FUNCTIONAL FLUIDS AND PLASTICIZER BUSINESS GROUPS, AND THE MEDICAL AND LAW DEPARTMENTS IS AS FOLLOWS:

1. Appoint a Project Manager - responsible for the overall management of the Aroclor pollution problem. He would be assisted by a Task Force from members of each Business Group plus Medical, Law, Engineering and Manufacturing.

2. Notify all Aroclor customers of PCB problem and relabel containers - within 60 days.

3. Clean up Monsanto plants' effluents within 12 months.

4. Develop and implement new packaging systems for Aroclor 1254/1260 - within 6 months.

5. Educate customers on need for clean-up at their plants - within 4 months.

6. Introduct to market, replacement products for Aroclor 1254/1260 - beginning 1/1/70 (Fluids), 4/1/70 (Plasticizers).

RECOMMENDED ACTION PLAN

7. Continue and expand biodegratation test program with Aroclor series, particularly 1242, 1248 and 1254.

8. Continue toxicological test program.

9. Accelerate present analytical test program.

10. Determine feasibility and cost of eliminating 5/6 Cl_2 in Aroclors 1242 and 1248. (3/70)

11. Study incineration products. (3/70)

12. Develop business plan to offer:

    Monsanto Fluid Reclamation and Recovery with Enviro Chem (4/70). (Reclamation already underway at Findett.)

WHAT COULD WE EXPECT FROM THIS PROGRAM?

Through this action program, Monsanto would expect to:

1. Retain or convert a good portion of our business and profits:

PROBLEMS	CONVERT OR RETAIN	$M SALES OUT OF PRESENT	ODDS OF SUCCESS
a. Confined to A-1254/ 1260.	$20.3 M	$22 M	70%
b. Spreads to A-1248 and 1242.	$10 M	$22 M	60%

2. Gain further valuable knowledge and time to:
   a. Learn more facts.
   b. Protect our position.
   c. Make further decisions regarding our program.
   d. Contribute to overall pollution knowledge.
3. Clean-up the major contributing PCB pollution factors.
4. Minimize customer complaints and hardships.

~~-22-~~ 23

The Program Would:

1. Cost some money.

   Est. SARE - $400-500 M

   Est. Capital - $700 M

   $1.1 M - 1.2 M

2. Expose us to continued adverse publicity and possible law suits.

3. Cause some customer discontent - but much less than an abrupt termination of production.

MDNS 058753
